Example	22
Language Usage	23
General	23
G-1010: Try to label your sub blocks.	23
G-1020: Always have a matching loop or block label.	24
G-1030: Avoid defining variables that are not used. G-1040: Avoid dead code.	26 27
O 10 10,707010 acut 0000.	

G-1050: Avoid using literals in your code.	29
G-1060: Avoid storing ROWIDs or UROWIDs in database tables.	30
G-1070: Avoid nesting comment blocks.	31
G-1080: Avoid using the same expression on both sides of a relational comparison operator or a logical operator.	32
Variables & Types	33
General C 2110 Truth was and hard declarations for warishing constants and trues	33
G-2110: Try to use anchored declarations for variables, constants and types.	33
G-2120: Try to have a single location to define your types.	35
G-2130: Try to use subtypes for constructs used often in your code.	36
G-2135: Avoid assigning values to local variables that are not used by a subsequent statement. G-2140: Never initialize variables with NULL.	37
G-2145: Never self-assign a variable.	38
G-2150: Avoid comparisons with NULL value, consider using IS [NOT] NULL.	39
G-2160: Avoid initializing variables using functions in the declaration section.	40
G-2170: Never overload variables.	41
G-2180: Never use quoted identifiers.	42
G-2185: Avoid using overly short names for explicitly or implicitly declared identifiers.	43
G-2190: Avoid using ROWID or UROWID.	44
Numeric Data Types	45
G-2210: Avoid declaring NUMBER variables, constants or subtypes with no precision.	45
G-2220: Try to use PLS_INTEGER instead of NUMBER for arithmetic operations with integer values.	46
G-2230: Try to use SIMPLE_INTEGER datatype when appropriate.	47
Character Data Types	48
G-2310: Avoid using CHAR data type.	48
G-2320: Never use VARCHAR data type.	49
G-2330: Never use zero-length strings to substitute NULL.	50
G-2340: Always define your VARCHAR2 variables using CHAR SEMANTIC (if not defined anchored).	51
Boolean Data Types	52
G-2410: Try to use boolean data type for values with dual meaning.	52
Large Objects	53
G-2510: Avoid using the LONG and LONG RAW data types.	53
Cursor Variables	54
G-2610: Never use self-defined weak ref cursor types.	54
DML & SQL	55
General	55
G-3110: Always specify the target columns when coding an insert statement.	55
G-3115: Avoid self-assigning a column.	56
G-3120: Always use table aliases when your SQL statement involves more than one source.	57
G-3130: Try to use ANSI SQL-92 join syntax.	59
G-3140: Try to use anchored records as targets for your cursors.	60
G-3145: Avoid using SELECT * directly from a table or view.	61
G-3150: Try to use identity columns for surrogate keys.	62
G-3160: Avoid visible virtual columns.	63
G-3170: Always use DEFAULT ON NULL declarations to assign default values to table columns if you refuse to store NULL values.	65
G-3180: Always specify column names instead of positional references in ORDER BY clauses.	67
G-3182: Always specify column names/aliases instead of positional references in GROUP BY clauses.	68
G-3183: Always specify column aliases instead of expressions in GROUP BY clauses.	69
G-3185: Never use ROWNUM at the same query level as ORDER BY.	70
G-3190: Avoid using NATURAL JOIN.	71
G-3195: Always use wildcards in a LIKE clause.	72
Bulk Operations	73
G-3210: Always use BULK OPERATIONS (BULK COLLECT, FORALL) whenever you have to execute a DML statement for more than 4 times.	73
G-3220: Always process saved exceptions from a FORALL statement.	74
Transaction Control	75
G-3310: Never commit within a cursor loop.	75
G-3320: Try to move transactions within a non-cursor loop into procedures.	77
G-3330: Avoid autonomous transactions.	79
Control Structures	80
CURSOR	80
G-4110: Always use %NOTFOUND instead of NOT %FOUND to check whether a cursor returned data.	80
G-4120: Avoid using %NOTFOUND directly after the FETCH when working with BULK OPERATIONS and LIMIT clause.	82
G-4130: Always close locally opened cursors.	84
G-4140: Avoid executing any statements between a SQL operation and the usage of an implicit cursor attribute.	85
CASE / IF / DECODE / NVL / NVL2 / COALESCE	87
G-4210: Try to use CASE rather than an IF statement with multiple ELSIF paths.	87
G-4220: Try to use CASE rather than DECODE.	88
G-4230: Always use a COALESCE instead of a NVL command, if parameter 2 of the NVL function is a function call or a SELECT statement.	90
G-4240: Always use a CASE instead of a NVL2 command if parameter 2 or 3 of NVL2 is either a function call or a SELECT statement.	91
G-4250: Avoid using identical conditions in different branches of the same IF or CASE statement.	92

G-4270: Avoid comparing boolean values to boolean literals.	94
Flow Control	95
G-4310: Never use GOTO statements in your code.	95
G-4320: Always label your loops.	97
G-4325: Never reuse labels in inner scopes.	99
G-4330: Always use a CURSOR FOR loop to process the complete cursor results unless you are using bulk operations.	100
G-4340: Always use a NUMERIC FOR loop to process a dense array.	101
G-4350: Always use 1 as lower and COUNT() as upper bound when looping through a dense array. G-4360: Always use a WHILE loop to process a loose array.	102
G-4365: Never use unconditional CONTINUE or EXIT in a loop.	104
G-4370: Avoid using EXIT to stop loop processing unless you are in a basic loop.	100
G-4375: Always use EXIT WHEN instead of an IF statement to exit from a loop.	109
G-4380: Try to label your EXIT WHEN statements.	110
G-4385: Never use a cursor for loop to check whether a cursor returns data.	112
G-4387: Never use a FOR LOOP for a query that should return not more than one row.	113
G-4390: Avoid use of unreferenced FOR loop indexes.	114
G-4395: Avoid hard-coded upper or lower bound values with FOR loops.	115
	116
Exception Handling	116
G-5010: Try to use a error/logging framework for your application.	116
G-5020: Never handle unnamed exceptions using the error number.	117
G-5030: Never assign predefined exception names to user defined exceptions.	118
G-5040: Avoid use of WHEN OTHERS clause in an exception section without any other specific handlers. G-5050: Avoid use of the RAISE_APPLICATION_ERROR built-in procedure with a hard-coded 20nnn error number or hard-coded message.	120
G-5050: Avoid use of the RAISE_APPLICATION_ERROR built-in procedure with a hard-coded 20nnn error number or hard-coded message. G-5060: Avoid unhandled exceptions.	121 122
G-5070: Avoid using Oracle predefined exceptions.	123
G-5080: Always use FORMAT_ERROR_BACKTRACE when using FORMAT_ERROR_STACK or SQLERRM.	123
Dynamic SQL	126
G-6010: Always use a character variable to execute dynamic SQL.	126
G-6020: Try to use output bind arguments in the RETURNING INTO clause of dynamic DML statements rather than the USING clause.	127
Stored Objects	128
General	128
G-7110: Try to use named notation when calling program units.	128
G-7120: Always add the name of the program unit to its end keyword.	129
G-7125: Always use CREATE OR REPLACE instead of CREATE alone.	130
G-7130: Always use parameters or pull in definitions rather than referencing external variables in a local program unit.	131
G-7140: Always ensure that locally defined procedures or functions are referenced.	133
G-7150: Try to remove unused parameters.	134
G-7160: Always explicitly state parameter mode.	135
G-7170: Avoid using an IN OUT parameter as IN or OUT only.	136
Packages	138
G-7210: Try to keep your packages small. Include only few procedures and functions that are used in the same context.	138
G-7220: Always use forward declaration for private functions and procedures.	139
G-7230: Avoid declaring global variables public.	141
G-7250: Never use RETURN in package initialization block.	143
Procedures	144
G-7310: Avoid standalone procedures – put your procedures in packages.	144
G-7320: Avoid using RETURN statements in a PROCEDURE.	145
G-7330: Always assign values to OUT parameters. Functions	146
	147
G-7410: Avoid standalone functions – put your functions in packages. G-7420: Always make the RETURN statement the last statement of your function.	147 148
G-7420. Always make the RETORN statement the last statement of your function. G-7430: Try to use no more than one RETURN statement within a function.	140
G-7440: Never use OUT parameters to return values from a function.	150
G-7440. Never return a NULL value from a BOOLEAN function.	151
G-7460: Try to define your packaged/standalone function deterministic if appropriate.	152
Oracle Supplied Packages	153
G-7510: Always prefix Oracle supplied packages with owner schema name.	153
Object Types	154
Triggers	155
G-7710: Avoid cascading triggers.	155
G-7720: Never use multiple UPDATE OF in trigger event clause.	157
G-7730: Avoid multiple DML events per trigger.	158
G-7740: Never handle multiple DML events per trigger if primary key is assigned in trigger.	159
Sequences	161
G-7810: Never use SQL inside PL/SQL to read sequence numbers (or SYSDATE).	161
SQL Macros	162
G-7910: Never use DML within a SQL macro.	162
Patterns	163
Checking the Number of Rows	163

G-8110: Never use SELECT COUNT(*) if you are only interested in the existence of a row.	163
G-8120: Never check existence of a row to decide whether to create it or not.	165
Access objects of foreign application schemas	166 166
G-8210: Always use synonyms when accessing objects of another application schema. Validating input parameter size	167
G-8310: Always validate input parameter size by assigning the parameter to a size limited variable in the declaration section of program unit	
Ensure single execution at a time of a program unit	170
G-8410: Always use application locks to ensure a program unit is only running once at a given time.	170
Use dbms_application_info package to follow progress of a process	173
G-8510: Always use dbms_application_info to track program process transiently.	173
Function Usage	175
G-9010: Always use a format model in string to date/time conversion functions.	175
G-9020: Try to use a format model and NLS_NUMERIC_CHARACTERS in string to number conversion functions.	176
G-9030: Try to define a default value on conversion errors. Restriction	177 177
G-9040: Try using FX in string to date/time conversion format model to avoid fuzzy conversion.	178

About

Foreword

In the I.T. world of today, robust and secure applications are becoming more and more important. Many business processes no longer work without I.T. and the dependence of businesses on their I.T. has grown tremendously, meaning we need robust and maintainable applications. An important requirement is to have standards and guidelines, which make it possible to maintain source code created by a number of people quickly and easily. This forms the basis of well functioning off- or on-shoring strategy, as it allows quality assurance to be carried out efficiently at the source.

Good standards and guidelines are based on the wealth of experience and knowledge gained from past (and future?) problems, such as those, which can arise in a cloud environment, for example.

h. pm/m.

Urban Lankes Chairman biGENIUS AG

The Oracle Database Developer community is made stronger by resources freely shared by experts around the world, such as the Trivadis Coding Guidelines. If you have not yet adopted standards for writing SQL and PL/SQL in your applications, this is a great place to start.

Steven Feuerstein

Steven Feuerstein Senior Advisor Insum Solutions

Coding Guidelines are a crucial part of software development. It is a matter of fact, that code is more often read than written – therefore we should take efforts to ease the work of the reader, which is not necessarily the author.

I am convinced that this standard may be a good starting point for your own guidelines.

Revision History

The first version of these guidelines was compiled by Roger Troller on March 17, 2009. Jörn Kulessa, Daniela Reiner, Richard Bushnell, Andreas Flubacher and Thomas Mauch helped Roger complete version 1.2 until August 21, 2009. This was the first GA version. The handy printed version in A5 format was distributed free of charge at the DOAG Annual Conference and on other occasions. Since then Roger updated the guidelines regularily. Philipp Salvisberg was involved in the review process for version 3.0 which was a major update. Philipp took the lead, after Roger left Trivadis in 2016. In 2020 Kim Berg Hansen started handling guidelines maintenance, letting Philipp concentrate on the related Trivadis db* CODECOP tool suite. After Kim left in September 2022, Philipp took over again until August 2024.

Since July, 7 2018 these guidelines are hosted on GitHub. Ready to be enhanced by the community and forked to fit specific needs.

On https://github.com/Trivadis/plsql-and-sql-coding-guidelines/releases you find the release information for every version since 1.2.

Introduction

This document describes rules and recommendations for developing applications using the PL/SQL & SQL Language.

Scope

This document applies to the PL/SQL and SQL language as used within Oracle Databases and tools, which access Oracle Databases version 11g Release 2 or later.

Document Conventions

SQALE (Software Quality Assessment based on Lifecycle Expectations) is a method to support the evaluation of a software application source code. It is a generic method, independent of the language and source code analysis tools.

SQALE characteristics and subcharacteristics

Characteristic	Description and Subcharacteristics
Changeability	The capability of the software product to enable a specified modification to be implemented. • Architecture related changeability • Logic related changeability • Data related changeability
Efficiency	The capability of the software product to provide appropriate performance, relative to the amount of resources used, under stated conditions. • Memory use • Processor use • Network use
Maintainability	The capability of the software product to be modified. Modifications may include corrections, improvements or adaptation of the software to changes in environment, and in requirements and functional specifications. • Understandability • Readability
Portability	The capability of the software product to be transferred from one environment to another. Compiler related portability Hardware related portability Language related portability OS related portability Software related portability Time zone related portability.

Reliability The capability of the software product to maintain a specified level of performance when used under specified conditions. · Architecture related reliability • Data related reliability Exception handling • Fault tolerance Instruction related reliability • Logic related reliability Resource related reliability · Synchronization related reliability Unit tests coverage. Reusability The capability of the software product to be reused within the development process. Modularity • Transportability. The capability of the software product to protect information and data so that unauthorized persons or systems Security cannot read or modify them and authorized persons or systems are not denied access to them. API abuse • Errors (e.g. leaving a system in a vulnerable state) Input validatation and representation Security features. Testability The capability of the software product to enable modified software to be validated. • Integration level testability • Unit level testability.

Severity of the rule

Blocker

Will or may result in a bug; for example, an incorrect result or a runtime exception.

4

Critical

Will have a high/direct impact on the maintenance cost. May have an impact on runtime behavior; for example, incomplete audit data or slower runtime performance.

Major

Will have a medium/potential impact on the maintenance cost. May have an impact on runtime behavior; for example, higher memory consumption.

Minor

Will have a low impact on the maintenance cost. No impact on the runtime behavior.

Info

Very low impact; it is just a remediation cost report. No impact on runtime behavior. For example, a NOSONAR marker comment.

Keywords used

Keyword	Meaning
Always	Emphasizes this rule must be enforced.
Never	Emphasizes this action must not happen.
Avoid	Emphasizes that the action should be prevented, but some exceptions may exist.
Try	Emphasizes that the rule should be attempted whenever possible and appropriate.
Example	Precedes text used to illustrate a rule or a recommendation.
Reason	Explains the thoughts and purpose behind a rule or a recommendation.
Restriction	Describes the circumstances to be fulfilled to make use of a rule.

Validator support

The tool db* CODECOP (see the "Tool Support" chapter) cannot support all the guidelines in this document. Those guidelines that are *not* supported by db* CODECOP validators are marked like this:

★ Unsupported in db* CODECOP Validators

Reason why the specific guideline is not supported by the validators.

The db* CODECOP repository documents the details of validator limitations.

Why are standards important

For a machine executing a program, code formatting is of no importance. However, for the human eye, well-formatted code is much easier to read. Modern tools can help to implement format and coding rules.

Implementing formatting and coding standards has the following advantages for PL/SQL development:

- Well-formatted code is easier to read, analyze and maintain (not only for the author but also for other developers).
- The developers do not have to define their own guidelines it is already defined.
- The code has a structure that makes it easier to avoid making errors.
- The code is more efficient concerning performance and organization of the whole application.
- The code is more modular and thus easier to use for other applications.

We have other standards

This document only defines possible standards. These standards are not written in stone, but are meant as guidelines. If standards already exist, and they are different from those in this document, it makes no sense to change them.

We do not agree with all your standards

There are basically two types of standards.

1. Non-controversial

These standards make sense. There is no reason not to follow them. An example of this category is G-2150: Avoid comparisons with NULL value, consider using IS [NOT] NULL.

2. Controversial

Almost every rule/guideline falls into this category. An example of this category is 3 space indention. - Why not 2 or 4 or even 8? Why not use tabs? You can argue in favor of all these options. In most cases it does not really matter which option you choose. Being consistent is more important. In this case it will make the code easier to read.

For very controversial rules, we have started to include the reasoning either as a footnote or directly in the text.

Usually it is not helpful to open an issue on GitHub to request to change a highly controversial rule such as the one mentioned. For example, use 2 spaces instead of 3 spaces for an indentation. This leads to a discussion where the people in favor of 4 spaces start to argument as well. There is no right or wrong here. You just have to agree on a standard.

More effective is to fork this repository and amend the standards to fit your needs/expectations.

Naming Conventions

General Guidelines

- 1. Never use names with a leading numeric character.
- 2. Always choose meaningful and specific names.
- 3. Avoid using abbreviations unless the full name is excessively long.
- 4. Avoid long abbreviations. Abbreviations should be shorter than 5 characters.
- 5. Any abbreviations must be widely known and accepted.
- 6. Create a glossary with all accepted abbreviations.
- 7. Never use keywords as names. A list of keywords may be found in the dictionary view v\$reserved_words.
- 8. Avoid adding redundant or meaningless prefixes and suffixes to identifiers. Example: create table emp_table.
- 9. Always use one spoken language (e.g. English, German, French) for all objects in your application.
- 10. Always use the same names for elements with the same meaning.

Naming Conventions for PL/SQL

In general, the Oracle Database is not case sensitive with names. A variable named personname is equal to one named PersonName, as well as to one named PERSONNAME. Some products (e.g. TMDA by Trivadis, APEX, OWB) put each name within double quotes (") so the Oracle Database will treat these names to be case sensitive. Using case sensitive variable names force developers to use double quotes for each reference to the variable. Our recommendation is to write all names in lowercase and to avoid double quoted identifiers.

A widely used convention is to follow a {prefix}variablecontent{suffix} pattern.

The following table shows a possible set of naming conventions.

Identifier	Prefix	Suffix	Example
Global Variable	g_		g_version
Local Variable	1_		l_version
Cursor	C_		c_employees
Record	r_		r_employee
Array / Table	t_		t_employees
Object	0_		o_employee
Cursor Parameter	p_		p_empno

In Parameter	in_		in_empno
Out Parameter	out_		out_ename
In/Out Parameter	io_		io_employee
Record Type Definitions	r_	_type	r_employee_type
Array/Table Type Definitions	t_	_type	t_employees_type
Exception	e_		e_employee_exists
Constants	co_		co_empno
Subtypes		_type	big_string_type

Database Object Naming Conventions

Never enclose object names (table names, column names, etc.) in double quotes to enforce mixed case or lower case object names in the data dictionary.

Collection Type

A collection type should include the name of the collected objects in their name. Furthermore, they should have the suffix _ct to identify it as a collection.

Optionally prefixed by a project abbreviation.

- employees_ct
- orders_ct

Column

Singular name of what is stored in the column (unless the column data type is a collection, in this case you use plural names)

Add a comment to the database dictionary for every column.

Check Constraint

Table name or table abbreviation followed by the column and/or role of the check constraint, a _ck and an optional number suffix.

Examples:

- employees_salary_min_ck
- orders_mode_ck

DML / Instead of Trigger

Choose a naming convention that includes:

either

- the name of the object the trigger is added to,
- any of the triggering events:
 - _br_iud for Before Row on Insert, Update and Delete
 - _io_id for Instead of Insert and Delete

or

- the name of the object the trigger is added to,
- · the activity done by the trigger,
- the suffix _trg

Examples:

- employees_br_iud
- orders_audit_trg
- orders_journal_trg

Foreign Key Constraint

Table abbreviation followed by referenced table abbreviation followed by a _fk and an optional number suffix.

- empl_dept_fk
- sct_icmd_ic_fk1

Function

Name is built from a verb followed by a noun in general. Nevertheless, it is not sensible to call a function get_... as a function always gets something.

The name of the function should answer the question "What is the outcome of the function?"

Optionally prefixed by a project abbreviation.

Example: employee_by_id

If more than one function provides the same outcome, you have to be more specific with the name.

Index

Indexes serving a constraint (primary, unique or foreign key) are named accordingly.

Other indexes should have the name of the table and columns (or their purpose) in their name and should also have _idx as a suffix.

Object Type

The name of an object type is built by its content (singular) followed by a _ot suffix.

Optionally prefixed by a project abbreviation.

Example: employee_ot

Package

Name is built from the content that is contained within the package.

Optionally prefixed by a project abbreviation.

Examples:

- employees_api API for the employee table
- logging_up Utilities including logging support

Primary Key Constraint

Table name or table abbreviation followed by the suffix _pk.

- employees_pk
- departments_pk
- sct_contracts_pk

Procedure

Name is built from a verb followed by a noun. The name of the procedure should answer the question "What is done?"

Procedures and functions are often named with underscores between words because some editors write all letters in uppercase in the object tree, so it is difficult to read them.

Optionally prefixed by a project abbreviation.

Examples:

- calculate_salary
- set_hiredate
- check_order_state

Sequence

Name is built from the table name (or its abbreviation) the sequence serves as primary key generator and the suffix _seq or the purpose of the sequence followed by a _seq.

Optionally prefixed by a project abbreviation.

Examples:

- employees_seq
- order_number_seq

Synonym

Synonyms should be used to address an object in a foreign schema rather than to rename an object. Therefore, synonyms should share the name with the referenced object.

System Trigger

Name of the event the trigger is based on.

- Activity done by the trigger
- Suffix _trg

- ddl_audit_trg
- logon_trg

Table

Plural¹ name of what is contained in the table (unless the table is designed to always hold one row only – then you should use a singular name).

Suffixed by _eb when protected by an editioning view.

Add a comment to the database dictionary for every table and every column in the table.

Optionally prefixed by a project abbreviation.

Examples:

- employees
- departments
- countries_eb table interfaced by an editioning view named countries
- sct_contracts
- sct_contract_lines
- sct_incentive_modules

Temporary Table (Global Temporary Table)

Naming as described for tables.

Optionally suffixed by _tmp

Optionally prefixed by a project abbreviation.

Examples:

- employees_tmp
- contracts_tmp

Unique Key Constraint

Table name or table abbreviation followed by the role of the unique key constraint, a _uk and an optional number suffix.

- employees_name_uk
- departments_deptno_uk
- sct_contracts_uk
- sct_coli_uk
- sct_icmd_uk1

View

Plural¹ name of what is contained in the view. Optionally suffixed by an indicator identifying the object as a view (mostly used, when a 1:1 view layer lies above the table layer)

Editioning views are named like the original underlying table to avoid changing the existing application code when introducing edition based redefinition (EBR).

Add a comment to the database dictionary for every view and every column.

Optionally prefixed by a project abbreviation.

- active_orders
- orders_v a view to the orders table
- countries an editioning view for table countries_eb

Coding Style

Formatting

Rules

Rule	Description
1	Keywords and names are written in lowercase ² .
2	3 space indention ³ .
3	One command per line.
4	Keywords loop, else, elsif, end if, when on a new line.
5	Commas in front of separated elements.
6	Call parameters aligned, operators aligned, values aligned.
7	SQL keywords are right aligned within a SQL command.
8	Within a program unit only line comments are used.
9	Brackets are used when needed or when helpful to clarify a construct.

Example

```
1
    create or replace package body employee_api is
 2
       procedure set_salary(in_employee_id in integer) is
 3
          co_employee_id constant employees.employee_id%type := in_employee_id;
 4
 5
          cursor c_employees(p_employee_id in employees.employee_id%type) is
            select last_name
 6
                  ,first_name
 7
                   , salary
8
9
               from employees
10
              where employee_id = p_employee_id
              order by last_name
11
12
                  ,first_name;
13
14
          r_employee c_employees%rowtype;
15
          1_new_salary employees.salary%type;
16
       begin
       open c_employees(p_employee_id => co_employee_id);
17
18
          fetch c_employees into r_employee;
19
          close c_employees;
20
21
          new_salary(in_employee_id => in_employee_id
22
                    , out_salary => l_new_salary);
23
24
          -- Check whether salary has changed
25
         if r_employee.salary <> l_new_salary then
26
            update employees
27
                set salary = l_new_salary
28
              where employee_id = in_employee_id;
29
          end if;
30
       end set_salary;
31 end employee_api;
```

Code Commenting

Conventions

Inside a program unit only use the line commenting technique -- unless you temporarly deactivate code sections for testing.

To comment the source code for later document generation, comments like /** ... */ are used. Within these documentation comments, tags may be used to define the documentation structure.

Tools like Oracle SQL Developer or PL/SQL Developer include documentation functionality based on a javadoc-like tagging.

Commenting Tags

Tag	Meaning	Example
param	Description of a parameter.	@param in_string input string
return	Description of the return value of a function.	@return result of the calculation
throws	Describe errors that may be raised by the program unit.	@throws NO_DATA_FOUND

Example

This is an example using the documentation capabilities of SQL Developer.

```
1 /**
2 Check whether we passed a valid sql name
3
4
   @param in_name string to be checked
   @return in_name if the string represents a valid sql name
5
   @throws ORA-44003: invalid SQL name
6
7
8 <b>Call Example:</b>
9
   10
      select TVDAssert.valid_sql_name('TEST') from dual;
       select TVDAssert.valid_sql_name('123') from dual
11
12
   13 */
```

Language Usage

General

G-1010: Try to label your sub blocks.

```
Maintainability
```

Reason

It's a good alternative for comments to indicate the start and end of a named processing.

Example (bad)

```
begin
2
      begin
3
         null;
   end;
4
5
      begin
6
7
         null;
8
       end;
9
   end;
10
```

```
1
     begin
 2 <<pre><prepare_data>>
 3
        begin
 4
            null;
 5 end prepare_data;
 6
 7
        <<pre><<pre><<pre><<pre><<pre><<pre><<pre><<pre><<pre>
8
         begin
9
            null;
10
        end process_data;
11 end good;
12
```

G-1020: Always have a matching loop or block label.

Minor

Maintainability

Reason

Use a label directly in front of loops and nested anonymous blocks:

- To give a name to that portion of code and thereby self-document what it is doing.
- So that you can repeat that name with the end statement of that block or loop.

Example (bad)

```
1
   declare
2
     i
                  integer;
     co_min_value constant integer := 1;
3
4
     co_max_value constant integer := 10;
5
      co_increment constant integer := 1;
6 begin
7
      <<pre><<pre><<pre>c
8
     begin
9
       null;
10 end;
11
      <<pre><<pre><<pre><<pre>c<ah</pre>
12
     begin
13
       null;
14
15 end;
16
17
     i := co_min_value;
      <<while_loop>>
18
19
     while (i <= co_max_value)</pre>
20
     loop
       i := i + co_increment;
21
22 end loop;
23
24
      <<basic_loop>>
25
     loop
26
       exit basic_loop when true;
end loop;
28
29
      <<for_loop>>
30
      for i in co_min_value..co_max_value
31
32
         sys.dbms_output.put_line(i);
33
      end loop;
34 end;
35
```

```
1
    declare
    i
 2
                  integer;
 3
      co_min_value constant integer := 1;
 4
       co_max_value constant integer := 10;
 5
       co_increment constant integer := 1;
 6 begin
 7
       <<pre><<pre><<pre>cdata>>
8
       begin
9
       null;
10 end prepare_data;
11
12
       <<pre><<pre><<pre><<pre><<pre><<pre><<pre><<pre>
13
       begin
14
       null;
15 end process_data;
16
17
       i := co_min_value;
       <<while_loop>>
18
19
       while (i <= co_max_value)</pre>
20
       loop
21
       i := i + co_increment;
22     end loop while_loop;
23
24
       <<basic_loop>>
25
       loop
26
       exit basic_loop when true;
27     end loop basic_loop;
28
29
       <<for_loop>>
30
       for i in co_min_value..co_max_value
31
32
          sys.dbms_output.put_line(i);
33
       end loop for_loop;
34 end;
35 /
```

G-1030: Avoid defining variables that are not used.

Major

Efficiency, Maintainability

Reason

Unused variables decrease the maintainability and readability of your code.

Example (bad)

```
create or replace package body my_package is
 2
     procedure my_proc is
   l_last_name employees.last_name%type;
l_first_name employees.first_name%type;
 3
 4
 5
        co_department_id constant departments.department_id%type := 10;
 6
         e_good exception;
 7
     begin
      select e.last_name
8
9
          into l_last_name
10
           from employees e
       where e.department_id = co_department_id;
11
12
     exception
      when no_data_found then
13
14
           null; -- handle_no_data_found;
        when too_many_rows then
15
16
           null; -- handle_too_many_rows;
17
      end my_proc;
18 end my_package;
19
```

```
create or replace package body my_package is
2
      procedure my_proc is
3
        1_last_name employees.last_name%type;
4
         co_department_id constant departments.department_id%type := 10;
5
        e_good exception;
    begin
6
7
      select e.last_name
8
          into l_last_name
9
          from employees e
10
         where e.department_id = co_department_id;
11
12
     raise e_good;
    exception
13
       when no_data_found then
14
15
          null; -- handle_no_data_found;
16
         when too_many_rows then
17
          null; -- handle_too_many_rows;
18
      end my_proc;
19
   end my_package;
20
```

Major

Maintainability

Reason

Any part of your code, which is no longer used or cannot be reached, should be eliminated from your programs to simplify the code.

Example (bad)

```
2
       co_dept_purchasing constant departments.department_id%type := 30;
 3
 4
       if 2 = 3 then -- dead code detection works with literals only
 5
         null; -- some dead code here
 6
       end if;
 7
8
       null; -- some enabled code here
9
10
       <<my_loop>>
11
       loop
12
       exit my_loop when true;
13
          null; -- some dead code here
14
       end loop my_loop;
15
16
       null; -- some other enabled code here
17
18
       when 1 = 1 and 'x' = 'y' then -- dead code detection works with literals only
19
20
             null; -- some dead code here
21
22
             null; -- some further enabled code here
23
       end case;
24
25
       <<my_loop2>>
26
       for r_emp in (
27
         select last_name
28
            from employees
29
           where department_id = co_dept_purchasing
30
              or commission_pct is not null
31
             and 5 = 6 -- dead code detection works with literals only
32
33
        -- "or commission_pct is not null" is dead code
34
       loop
          sys.dbms_output.put_line(r_emp.last_name);
35
36
       end loop my_loop2;
37
38
       return;
39
       null; -- some dead code here
40
    end:
41 /
```

```
1
    declare
 2
    co_dept_admin constant dept.deptno%type := 10;
 3 begin
4 null; -- some enabled code here
    null; -- some other enabled code here
null; -- some further enabled code here
 5
 6
 7
8 <<my_loop2>>
9 for r_emp in (
      select last_name
10
11
          from employees
         where department_id = co_dept_admin
12
           or commission_pct is not null
13
      )
14
15
      loop
       sys.dbms_output.put_line(r_emp.last_name);
16
       end loop my_loop2;
17
18 end;
19 /
```

G-1050: Avoid using literals in your code.

Minor

Changeability

Reason

Literals are often used more than once in your code. Having them defined as a constant reduces typos in your code and improves the maintainability.

All constants should be collated in just one package used as a library. If these constants should be used in SQL too it is good practice to write a deterministic package function for every constant.

To avoid an extreme plethora of constants or false positives, a literal should not occur more than once within a file.

Example (bad)

```
begin
some_api.setup(in_department_id => 10);
some_api.process(in_department_id => 10);
some_api.teardown(in_department_id => 10);
end;
///
some_api.teardown(in_department_id => 10);
```

```
1 create or replace package constants_up is
2
       co_dept_admin constant departments.department_id%type := 10;
3
    end constants_up;
4
5
6
   begin
7
       some_api.setup(in_department_id => constants_up.co_dept_admin);
       some_api.process(in_department_id => constants_up.co_dept_admin);
8
9
       some_api.teardown(in_department_id => constants_up.co_dept_admin);
10 end;
11
```

G-1060: Avoid storing ROWIDs or UROWIDs in database tables.

Reason

It is an extremely dangerous practice to store rowid's in a table, except for some very limited scenarios of runtime duration. Any manually explicit or system generated implicit table reorganization will reassign the row's rowid and break the data consistency.

Instead of using rowid for later reference to the original row one should use the primary key column(s).

Example (bad)

```
insert into employees_log (
2
    employee_id
,last_name
3
4
5 , first_name
6 , rid
7
7
     select employee_id
8
     ,last_name
9
      , first_name
10
           , rowid
11
12
        from employees;
13
   end;
```

```
1 begin
2
    insert into employees_log (
     employee_id
3
      ,last_name
4
5
       ,first_name
    )
6
7
     select employee_id
8
          ,last_name
9
           ,first_name
10
       from employees;
11 end;
12 /
```

G-1070: Avoid nesting comment blocks.

Minor

Maintainability

Reason

Having an end-of-comment within a block comment will end that block-comment. This does not only influence your code but is also very hard to read.

Example (bad)

```
begin
/* comment one -- nested comment two */
null;
-- comment three /* nested comment four */
null;
end;
//
```

```
begin
/* comment one, comment two */
null;
-- comment three, comment four
null;
end;
//
```

G-1080: Avoid using the same expression on both sides of a relational comparison operator or a logical operator.

Reason

Using the same value on either side of a binary operator is almost always a mistake. In the case of logical operators, it is either a copy/paste error and therefore a bug, or it is simply wasted code and should be simplified.

This rule ignores operators +, * and ||, and expressions: 1=1, 1<>1, 1!=1, 1~=1 and 1^=1.

Example (bad)

```
2
   co_max_salary constant emp.salary%type := 3000;
3 begin
4 select emp.first_name
      ,emp.last_name
5
           ,emp.salary
6
7
7 , emp.nire_date
8 from employees emp
           ,emp.hire_date
9 where emp.salary > co_max_salary
     or emp.salary > co_max_salary
10
order by emp.last_name, emp.first_name;
12 end;
13
   /
```

```
declare
2
    co_max_salary constant emp.salary%type := 3000;
3
   begin
   select emp.first_name
4
          ,emp.last_name
5
           ,emp.salary
6
           ,emp.hire_date
7
   from employees emp
8
9
      where emp.salary > co_max_salary
10
   order by emp.last_name, emp.first_name;
11
   end;
12
```

Variables & Types

General

G-2110: Try to use anchored declarations for variables, constants and types.

Major

Maintainability, Reliability

REASON

Changing the size of the database column last_name in the employees table from varchar2(20) to varchar2(30) will result in an error within your code whenever a value larger than the hard coded size is read from the table. This can be avoided using anchored declarations.

EXAMPLE (BAD)

```
create or replace package body my_package is
2
       procedure my_proc is
          1_last_name varchar2(20 char);
3
4
          co_first_row constant integer := 1;
5
     begin
6
         select e.last_name
7
           into l_last_name
           from employees e
8
9
          where rownum = co_first_row;
10
     exception
       when no_data_found then
11
            null; -- handle no_data_found
12
13
          when too_many_rows then
           null; -- handle too_many_rows (impossible)
14
     end my_proc;
15
16 end my_package;
17
```

```
create or replace package body my_package is
2
       procedure my_proc is
         1_last_name employees.last_name%type;
3
4
          co_first_row constant integer := 1;
5
       begin
       select e.last_name
6
7
           into l_last_name
8
           from employees e
9
          where rownum = co_first_row;
     exception
10
11
         when no_data_found then
12
            null; -- handle no_data_found
13
          when too_many_rows then
14
            null; -- handle too_many_rows (impossible)
15
       end my_proc;
16
   end my_package;
17
```

Minor

Changeability

REASON

Single point of change when changing the data type. No need to argue where to define types or where to look for existing definitions.

A single location could be either a type specification package or the database (database-defined types).

EXAMPLE (BAD)

```
1 create or replace package body my_package is
2
      procedure my_proc is
3
         subtype big_string_type is varchar2(1000 char);
4
          l_note big_string_type;
     begin
5
          l_note := some_function();
6
7
          do_something(l_note);
      end my_proc;
8
9 end my_package;
10
```

```
create or replace package types_up is
2
       subtype big_string_type is varchar2(1000 char);
3
   end types_up;
4
5
   create or replace package body my_package is
6
7
       procedure my_proc is
         l_note types_up.big_string_type;
8
9
     begin
10
          l_note := some_function();
         do_something(l_note);
11
      end my_proc;
12
13 end my_package;
14
```

G-2130: Try to use subtypes for constructs used often in your code.

Minor

Changeability

REASON

Single point of change when changing the data type.

Your code will be easier to read as the usage of a variable/constant may be derived from its definition.

Examples of possible subtype definitions:

Туре	Usage
ora_name_type	Object corresponding to the Oracle Database naming conventions (table, variable, column, package, etc.).
max_vc2_type	String variable with maximal VARCHAR2 size.
array_index_typ	Best fitting data type for array navigation.
id_type	Data type used for all primary key (id) columns.

EXAMPLE (BAD)

```
create or replace package body my_package is
procedure my_proc is

l_note varchar2(1000 char);

begin
 l_note := some_function();
 do_something(l_note);
end my_proc;
end my_package;

/
```

```
1
   create or replace package types_up is
2
      subtype big_string_type is varchar2(1000 char);
3 end types_up;
4
5
6 create or replace package body my_package is
7
     procedure my_proc is
8
         l_note types_up.big_string_type;
9
     begin
10
         1_note := some_function();
         do_something(l_note);
11
     end my_proc;
12
13 end my_package;
14
```

Major

Efficiency, Maintainability, Testability

REASON

Expending resources calculating and assigning values to a local variable and never use the value subsequently is at best a waste, at worst indicative of a mistake that leads to a bug.

EXAMPLE (BAD)

```
create or replace package body my_package is
2
     procedure my_proc is
3
        co_employee_id constant employees.employee_id%type := 1042;
                                           := 'Hello, ';
4
        co_hello constant type_up.text
5
        1_last_name employees.last_name%type;
        1_message
                    types_up.text;
7
     begin
8
       select emp.last_name
9
         into l_last_name
         from employees emp
10
        where emp.employee_id = co_employee_id;
11
12
exception
14
       when no_data_found then
15
          null; -- handle_no_data_found;
16
17
        when too_many_rows then
          null; -- handle_too_many_rows;
18
19
      end my_proc;
20 end my_package;
21
```

```
create or replace package body my_package is
2
     procedure my_proc is
3
        co_employee_id constant employees.employee_id%type := 1042;
4
         co_hello constant type_up.text
                                                 := 'Hello, ';
5
         1_last_name employees.last_name%type;
6
         l_message
                      types_up.text;
7
     begin
8
      select emp.last_name
9
          into l_last_name
10
          from employees emp
11
          where emp.employee_id = co_employee_id;
12
      l_message := co_hello || l_last_name;
13
14
        message_api.send_message(l_message);
15
16
       exception
17
        when no_data_found then
18
           null; -- handle_no_data_found;
19
        when too_many_rows then
20
           null; -- handle_too_many_rows;
21
       end my_proc;
22
   end my_package;
23
```

G-2140: Never initialize variables with NULL.

Minor

Maintainability

REASON

Variables are initialized to null by default.

EXAMPLE (BAD)

```
1 declare
1_note big_string_type := null;
3 begin
4 sys.dbms_output.put_line(l_note);
5 end;
6 /
```

```
1 declare
2 l_note big_string_type;
3 begin
4 sys.dbms_output.put_line(l_note);
5 end;
6 /
```

🇯 Blocker

Maintainability

REASON

There is no reason to assign a variable to itself. It is either a redundant statement that should be removed, or it is a mistake where some other value was intended in the assignment.

EXAMPLE (BAD)

```
1
    declare
2
     co_parallel_degree constant types_up.name%type := 'parallel_degree';
3
       l_function_result pls_integer;
4
       l_parallel_degree pls_integer;
5 begin
6
       1_function_result := maintenance.get_config(co_parallel_degree);
7
       if l_{\text{function\_result}} is not null then
8
          l_parallel_degree := l_parallel_degree;
9
          do_something(l_parallel_degree);
10
       end if;
11 end;
12 /
```

```
1
   declare
2
     co_parallel_degree constant types_up.name%type := 'parallel_degree';
3
       l_function_result pls_integer;
4
       l_parallel_degree pls_integer;
5 begin
6
       l_function_result := maintenance.get_config(co_parallel_degree);
7
       if l_function_result is not null then
8
          l_parallel_degree := l_function_result;
9
          do_something(l_parallel_degree);
10
       end if;
11
   end;
12
```

G-2150: Avoid comparisons with NULL value, consider using IS [NOT] NULL.

🏥 Blocker

Portability, Reliability

REASON

The null value can cause confusion both from the standpoint of code review and code execution. You must always use the is null or is not null syntax when you need to check if a value is or is not null.

EXAMPLE (BAD)

```
1 declare
2 l_value integer;
3 begin
4 if l_value = null then
5 null;
6 end if;
       null;
7 end;
8 /
```

```
1 declare
2 l_value integer;
3 begin
4 if l_value is null then
5 null;
6 end if;
       null;
7 end;
8 /
```

G-2160: Avoid initializing variables using functions in the declaration section.

Critical

Reliability

REASON

If your initialization fails, you will not be able to handle the error in your exceptions block.

EXAMPLE (BAD)

```
declare
co_department_id constant integer := 100;
l_department_name departments.department_name%type :=
department_api.name_by_id(in_id => co_department_id);
begin
sys.dbms_output.put_line(l_department_name);
end;
// end;
```

```
1
   declare
2
      co_department_id constant integer
                                                               := 100;
       co_unkown_name constant departments.department_name%type := 'unknown';
3
4
      1_department_name departments.department_name%type;
5 begin
6
      <<init>>
7
     begin
8 l_department_name := department_api.name_by_id(in_id => co_department_id);
     exception
9
       when value_error then
10
11
          1_department_name := co_unkown_name;
12
      end init;
13
       sys.dbms_output.put_line(l_department_name);
14
15
   end;
16
```

Major

Reliability

REASON

The readability of your code will be higher when you do not overload variables.

EXAMPLE (BAD)

```
begin
2
      <<main>>
3
       declare
                  constant user_objects.object_name%type := 'test_main';
4
        co_main
5
                   constant user_objects.object_name%type := 'test_sub';
         co_sub
                 constant user_objects.object_name%type := ' - ';
6
         co_sep
     1_variable user_objects.object_name%type := co_main;
7
     begin
8
9
        <<sub>>
        declare
10
           l_variable user_objects.object_name%type := co_sub;
11
12
        begin
           sys.dbms_output.put_line(l_variable
13
14
               || co_sep
15
               || main.l_variable);
16
         end sub;
17
       end main;
18
   end;
19
```

```
1
   begin
2
      <<main>>
3
      declare
                       constant user_objects.object_name%type := 'test_main';
4
       co_main
                         constant user_objects.object_name%type := 'test_sub';
5
         co_sub
                         constant user_objects.object_name%type := ' - ';
6
         co_sep
     l_main_variable user_objects.object_name%type := co_main;
7
8
     begin
9
         <<sub>>
10
        declare
11
           l_sub_variable user_objects.object_name%type := co_sub;
12
       begin
13
            sys.dbms_output.put_line(l_sub_variable
14
               || co_sep
15
                || l_main_variable);
          end sub;
16
17
       end main;
18
    end;
19
```

G-2180: Never use quoted identifiers.

Major

Maintainability

REASON

Quoted identifiers make your code hard to read and maintain.

EXAMPLE (BAD)

```
declare
2
      "sal+comm"
                                         -- violates also naming conventions (G-9102)
                   integer;
      "my constant" constant integer := 1; -- violates also naming conventions (G-9114)
3
     "my exception" exception; -- violates also naming conventsion (G-9113)
4
5 begin
      "sal+comm" := "my constant";
6
7
      do_something("sal+comm");
8 exception
    when "my exception" then
9
10
      null;
11 end;
12
   /
```

```
1
   declare
      1_sal_comm integer;
2
3
      co_my_constant constant integer := 1;
4
     e_my_exception exception;
5 begin
6
      1_sal_comm := co_my_constant;
7
      do_something(l_sal_comm);
8 exception
9
     when e_my_exception then
10
       null;
11 end;
12
```

G-2185: Avoid using overly short names for explicitly or implicitly declared identifiers.

Major

Maintainability

REASON

You should ensure that the name you have chosen well defines its purpose and usage. While you can save a few keystrokes typing very short names, the resulting code is obscure and hard for anyone besides the author to understand.

EXAMPLE (BAD)

```
1 declare
    i integer;
2
    c constant integer := 1; -- violates also naming conventions (G-9114)
3
4
     e exception; -- violates also naming conventions (G-9113)
5 begin
     i := c;
6
7
     do_something(i);
8 exception
    when e then
9
10
     null;
11 end;
12 /
```

```
1 declare
2
     l_sal_comm integer;
     co_my_constant constant integer := 1;
3
4
      e_my_exception exception;
5 begin
     l_sal_comm := co_my_constant;
do_something(l_sal_comm);
6
7
8
   exception
9
     when e_my_exception then
10
        null;
11 end;
12 /
```

G-2190: Avoid using ROWID or UROWID.

🇯 Blocker

Portability, Reliability

REASON

Be careful about your use of Oracle Database specific data types like rowid and urowid. They might offer a slight improvement in performance over other means of identifying a single row (primary key or unique index value), but that is by no means guaranteed.

Use of rowid or urowid means that your SQL statement will not be portable to other SQL databases. Many developers are also not familiar with these data types, which can make the code harder to maintain.

EXAMPLE (BAD)

```
1 declare
1_department_name departments.department_name%type;
3
    l_rowid rowid;
4 begin
5 update departments
6
      set department_name = l_department_name
7 where rowid = l_rowid;
8 end;
9 /
```

```
1 declare
  1_department_name departments.department_name%type;
2
3
      1_department_id departments.department_id%type;
4 begin
  update departments
5
6
       set department_name = 1_department_name
7
      where department_id = l_department_id;
8 end;
9
```

Numeric Data Types

G-2210: Avoid declaring NUMBER variables, constants or subtypes with no precision.

REASON

If you do not specify precision <code>number</code> is defaulted to 38 or the maximum supported by your system, whichever is less. You may well need all this precision, but if you know you do not, you should specify whatever matches your needs. Also, consider using a simpler data type that uses fewer resources, such as <code>pls_integer</code>.

EXAMPLE (BAD)

```
create or replace package types_up is
subtype salary_type is number;
end types_up;
//
```

```
create or replace package types_up is
subtype salary_type is number(5,1);
end types_up;
//
```

G-2220: Try to use PLS_INTEGER instead of NUMBER for arithmetic operations with integer values.

REASON

pls_integer having a length of -2,147,483,648 to 2,147,483,647, on a 32bit system.

There are many reasons to use pls_integer instead of number:

- pls_integer uses less memory
- pls_integer uses machine arithmetic, which is up to three times faster than library arithmetic, which is used by number .

EXAMPLE (BAD)

```
1 declare
    l_{result} number(9,0) := 0; -- violates also G-2130, G-2230
2
3
      co_upper_bound constant pls_integer := 1e8;
4 begin
5
      <<burning_cpu>>
     for i in 1..co_upper_bound
6
7
     loop
8
       if i > 0 then
            l_result := l_result + 1;
9
       end if;
10
     end loop burning_cpu;
11
      sys.dbms_output.put_line(l_result);
12
13 end;
14
```

```
1 declare
    l_result pls_integer
2
3
      co_upper_bound constant pls_integer := 1e8;
4 begin
5
      <<burning_less_cpu>>
     for i in 1..co_upper_bound
6
     loop
7
8
       if i > 0 then
            l_result := l_result + 1;
9
        end if;
10
11
     end loop burning_less_cpu;
12
      sys.dbms_output.put_line(l_result);
13
   end;
14
```

Efficiency

REASON

simple_integer does no checks on numeric overflow, which results in better performance compared to the other numeric datatypes.

With Oracle Database 11g, the new data type simple_integer has been introduced. It is a sub-type of pls_integer and covers the same range. The basic difference is that simple_integer is always not null. When the value of the declared variable is never going to be null then you can declare it as simple_integer. Another major difference is that you will never face a numeric overflow using simple_integer as this data type wraps around without giving any error. simple_integer data type gives major performance boost over pls_integer when code is compiled in native mode, because arithmetic operations on simple_integer type are performed directly at the hardware level.

EXAMPLE (BAD)

```
1
    declare
2
                   number(9,0)
                                         := 0;
                                               -- violates also G-2130, G-2220
   l_result
3
      co_upper_bound constant pls_integer := 1e8;
4
   begin
5
      <<burning_cpu>>
6
      for i in 1..co_upper_bound
7
      loop
       if i > 0 then
8
9
          l_result := l_result + 1;
10
        end if;
       end loop burning_cpu;
11
12
       sys.dbms_output.put_line(l_result);
13
   end;
14 /
```

```
1
    declare
       l_result
2
                   simple_integer
                                         := <mark>0</mark>;
3
       co_upper_bound constant pls_integer := 1e8;
4
    begin
5
       <<burning_cpu>>
6
       for i in 1..co_upper_bound
7
       loop
8
          if i > 0 then
9
           l_result := l_result + 1;
10
          end if;
11
       end loop burning_cpu;
12
       sys.dbms_output.put_line(l_result);
13
    end;
14
```

Character Data Types

G-2310: Avoid using CHAR data type.

REASON

char is a fixed length data type, which should only be used when appropriate. char columns/variables are always filled to its specified lengths; this may lead to unwanted side effects and undesired results.

EXAMPLE (BAD)

```
create or replace package types_up
subtype description_type is char(200);
end types_up;
//
```

Unexpected trailing spaces can lead to wrong results.

```
1 with
  dept as (
2
     select cast(department_name as varchar2(30 char)) as dname_vc2
3
4
        , cast(department_name as char(30 char)) as dname_char
5
          from departments
6
7
  select count(*)
    from dept
8
9
   where dname_vc2 = dname_char;
```

```
1 COUNT(*)
2 ------
3 0
```

G-2320: Never use VARCHAR data type.

🇯 Blocker

Portability, Reliability

REASON

Do not use the varchar data type. Use the varchar2 data type instead. Although the varchar data type is currently synonymous with varchar2, the varchar data type is scheduled to be redefined as a separate data type used for variable-length character strings compared with different comparison semantics.

EXAMPLE (BAD)

```
1 create or replace package types_up is
subtype description_type is varchar(200);
3 end types_up;
4 /
```

```
1 create or replace package types_up is
subtype description_type is varchar2(200 char);
3 end types_up;
4 /
```

G-2330: Never use zero-length strings to substitute NULL.

🏥 Blocker

Portability, Reliability

REASON

Today zero-length strings and null are currently handled identical by the Oracle Database. There is no guarantee that this will still be the case in future releases, therefore if you mean null use null.

EXAMPLE (BAD)

```
1 create or replace package body constants_up is
co_null_string constant types_up.text := '';
3
4
     function null_string return varchar2
5
        deterministic
6
     is
   begin
7
8     return co_null_string;
9 end null_string;
10 end constants_up;
11 /
```

```
1 create or replace package body constants_up is
function empty_string return varchar2
3
      deterministic
4 is begin
6 return null;
7 end empty_string;
8 end constants_up;
9 /
```

G-2340: Always define your VARCHAR2 variables using CHAR SEMANTIC (if not defined anchored).

Reliability

REASON

Changes to the <code>nls_length_semantic</code> will only be picked up by your code after a recompilation.

In a multibyte environment a varchar2(10) definition may not necessarily hold 10 characters when multibyte characters are part of the value that should be stored, unless the definition was done using the char semantic.

EXAMPLE (BAD)

```
create or replace package types_up is
subtype description_type is varchar2(200);
end types_up;
//
```

```
create or replace package types_up is
subtype description_type is varchar2(200 char);
end types_up;
//
```

Boolean Data Types

G-2410: Try to use boolean data type for values with dual meaning.

Minor

Maintainability

REASON

The use of true and false clarifies that this is a boolean value and makes the code easier to read.

EXAMPLE (BAD)

```
declare
2
       co_newfile constant pls_integer := 1000;
       co_oldfile constant pls_integer := 500;
3
   l_bigger pls_integer;
4
5 begin
      if co_newfile < co_oldfile then</pre>
6
7
          1_bigger := constants_up.co_numeric_true;
8
      else
9
          l_bigger := constants_up.co_numeric_false;
10
      end if;
       do_something(l_bigger);
11
12
   end;
13
```

EXAMPLE (BETTER)

```
1 declare
2
      co_newfile constant pls_integer := 1000;
       co_oldfile constant pls_integer := 500;
3
4 l_bigger boolean;
5 begin
   if co_newfile < co_oldfile then</pre>
6
7
          l_bigger := true;
8
     else
9
         l_bigger := false;
     end if;
10
       do_something(l_bigger);
11
12 end;
13
```

```
declare
    co_newfile constant pls_integer := 1000;
    co_oldfile constant pls_integer := 500;

4    l_bigger boolean;

5    begin
6    l_bigger := nvl(co_newfile < co_oldfile, false);
7    do_something(l_bigger);
8    end;
9    /</pre>
```

Large Objects

G-2510: Avoid using the LONG and LONG RAW data types.

Major

Portability

REASON

long and long raw data types have been deprecated by the Oracle Database since version 8i - support might be discontinued in future Oracle Database releases.

There are many constraints to long datatypes in comparison to the lob types.

EXAMPLE (BAD)

```
declare
l_long long; -- violates also G-2130
l_raw long raw; -- violates also G-2130

begin
do_something(l_long);
do_something(l_raw);
end;

// end;
```

Cursor Variables

G-2610: Never use self-defined weak ref cursor types.

Minor

Changeability, Maintainability, Portability, Reusability

REASON

There is no reason to define your own weak ref cursor types, as they are not different from the built-in sys_refcursor. Introducing your own types just gives you unnecessary maintenance to perform.

EXAMPLE (BAD)

```
1 declare
     type local_weak_cursor_type is ref cursor;
3
     c_data local_weak_cursor_type;
     if configuration.use_employee then
5
6
        open c_data for
7
           select e.employee_id, e.first_name, e.last_name
8
              from employees e;
9
     else
10
        open c_data for
           select e.emp_id,e.name
11
12
              from emp e;
     end if;
13
14 end;
15 /
```

```
1 declare
c_data sys_refcursor;
3 begin
4
     if configuration.use_employee then
5
        open c_data for
6
           select e.employee_id, e.first_name, e.last_name
7
             from employees e;
8
     else
9
        open c_data for
10
           select e.emp_id,e.name
11
             from emp e;
12
     end if;
13 end;
14 /
```

General

G-3110: Always specify the target columns when coding an insert statement.

REASON

Data structures often change. Having the target columns in your insert statements will lead to change-resistant code.

EXAMPLE (BAD)

```
1 create or replace package body dept_api is
2
     procedure ins_dept(in_dept_row in dept%rowtype) is
3
4 insert into departments
5 values (
          departments_seq.nextval
7
          ,in_dept_row.department_name
8
           ,in_dept_row.manager_id
9
           ,in_dept_row.location_id
10
         );
11
      end ins_dept;
12 end dept_api;
13 /
```

```
create or replace package body dept_api is
2
     procedure ins_dept(in_dept_row in dept%rowtype) is
3
       begin
4
          insert into departments (
5
           department_id
6
           , department_name
7
           , manager_id
            ,location_id
8
9
10
        values (
11
           departments_seq.nextval
12
           ,in_dept_row.department_name
13
           ,in_dept_row.manager_id
14
            ,in_dept_row.location_id
15
          );
16
       end ins_dept;
17
   end dept_api;
18
```

G-3115: Avoid self-assigning a column.

Blocker

Maintainability

REASON

There is normally no reason to assign a column to itself. It is either a redundant statement that should be removed, or it is a mistake where some other value was intended in the assignment.

One exception to this rule can be when you attempt to fire cross edition triggers when using Edition Based Redefinition.

EXAMPLE (BAD)

```
1 update employees
2 set first_name = first_name;
```

```
1 update employees
2 set first_name = initcap(first_name);
```

G-3120: Always use table aliases when your SQL statement involves more than one source.

Blocker

Maintainability

REASON

It is more human readable to use aliases instead of writing columns with no table information.

Especially when using subqueries the omission of table aliases may end in unexpected behavior and result.

EXAMPLE (BAD)

```
select last_name
1
   , first_name
2
3
       , department_name
4 from employees
    join departments
5
6 using (department_id)
7 where extract(month from hire_date) = extract(month from sysdate);
```

If the jobs table has no employee_id column and employees has one this query will not raise an error but return all rows of the employees table as a subquery is allowed to access columns of all its parent tables - this construct is known as correlated subquery.

```
select last_name
    ,first_name
2
    from employees
3
  where employee_id in (
4
5
   select employee_id
6
              from jobs
7
             where job_title like '%Manager%' -- NOSONAR: G-1050 literal is ok for a standalone
query
8
         );
```

EXAMPLE (BETTER)

```
select e.last_name
2
    ,e.first_name
3
        ,d.department_name
    from employees e
4
5
    join departments d
      on (e.department_id = d.department_id)
6
7
    where extract(month from e.hire_date) = extract(month from sysdate);
```

EXAMPLE (GOOD)

Using meaningful aliases improves the readability of your code.

```
select emp.last_name
1
    ,emp.first_name
2
3
        ,dept.department_name
4 from employees emp
    join departments dept
5
6
      on (emp.department_id = dept.department_id)
7
    where extract(month from emp.hire_date) = extract(month from sysdate);
```

If the jobs table has no employee_id column this query will return an error due to the directive (given by adding the

table alias to the column) to read the <code>employee_id</code> column from the <code>jobs</code> table.

```
select emp.last_name
    ,emp.first_name
from employees emp
where emp.employee_id in (
select job.employee_id
from jobs job
where job.job_title like '%Manager%' -- NOSONAR: G-1050 literal is ok for a standalone query
);
```

Major

Maintainability, Portability

REASON

ANSI SQL-92 join syntax supports the full outer join. A further advantage of the ANSI SQL-92 join syntax is the separation of the join condition from the query filters.

EXAMPLE (BAD)

```
select emp.employee_id
    ,emp.last_name
    ,emp.first_name
    ,dept.department_name

from employees emp

join departments dept

on dept.department_id = emp.department_id

where extract(month from emp.hire_date) = extract(month from sysdate);
```

Major

Maintainability, Reliability

REASON

Using cursor-anchored records as targets for your cursors results enables the possibility of changing the structure of the cursor without regard to the target structure.

EXAMPLE (BAD)

```
1
   declare
2
     cursor c_employees is
3
       select employee_id, first_name, last_name
4
          from employees;
5
      l_employee_id employees.employee_id%type;
6
      1_first_name employees.first_name%type;
7
      1_last_name employees.last_name%type;
8 begin
9
      open c_employees;
fetch c_employees into l_employee_id, l_first_name, l_last_name;
11
     <<pre><<pre><<pre><<pre><<pre><</pre>
12
     while c_employees%found
13
14
         -- do something with the data
end loop process_employees;
16
17
      close c_employees;
18 end;
19
```

```
1
    declare
2
     cursor c_employees is
3
        select employee_id, first_name, last_name
4
            from employees;
5
      r_employee c_employees%rowtype;
6 begin
7
       open c_employees;
8 fetch c_employees into r_employee;
9
       <<pre><<pre><<pre><<pre><<pre><</pre>
10
       while c_employees%found
11
12
          -- do something with the data
13
         fetch c_employees into r_employee;
14
       end loop process_employees;
15
       close c_employees;
16
   end;
17
```

🏥 Blocker

Efficiency, Maintainability, Reliability, Testability

REASON

Use of SELECT * when querying a table or view makes it impossible for the optimizer to take into account which columns will actually be used by the application, potentially leading to sub-optimal execution plans (for example full scanning the table where a full scan of an index might have sufficed.) Also SELECT * possibly can break your code in the future in case of changes to the table structure (for example new or invisible columns.)

Exceptions to the rule can be when querying an inline view (where the SELECT * is just to avoid repeating same columns as inside the inline view), or when fetching into records defined as MYTABLE%ROWTYPE for the purpose of processing all columns of the record.

EXAMPLE (BAD)

```
begin
2
     <<raise_salary>>
3
     for r_employee in (
4 select *
5
          from employees
6
7
      loop
8
       employee_api.calculate_raise_by_seniority(
9
           id in
                   => r_employee.id
           , salary_in => r_employee.salary
10
11
           ,hiredate_in => r_employee.hiredate
12
13
      end loop raise_salary;
14 end;
15
```

```
1
    begin
2
     <<raise_salary>>
3
      for r_employee in (
4 select id, salary, hiredate
5
          from employees
6
7
       loop
8
        employee_api.calculate_raise_by_seniority(
9
           id_in => r_employee.id
10
           , salary_in => r_employee.salary
11
           ,hiredate_in => r_employee.hiredate
         );
12
13
       end loop raise_salary;
14 end:
15
```

Critical

Maintainability, Reliability

RESTRICTION

Oracle Database 12c

REASON

An identity column is a surrogate key by design – there is no reason why we should not take advantage of this natural implementation when the keys are generated on database level. Using identity column (and therefore assigning sequences as default values on columns) has a huge performance advantage over a trigger solution.

EXAMPLE (BAD)

```
1 create table locations (
      location_id number(10) not null
,location_name varchar2(60 char) not null
,city varchar2(30 char) not null
 3
       , constraint locations_pk primary key (location_id)
 5
 6
      )
 7
8
9 create sequence location_seq start with 1 cache 20
10
11
12 create or replace trigger location_br_i
13 before insert on locations
14 for each row
15 begin
:new.location_id := location_seq.nextval;
17 end;
18 /
```

EXAMPLE (GOOD)

generated always as identity ensures that the location_id is populated by a sequence. It is not possible to override the behavior in the application.

However, if you use a framework that produces an insert statement including the surrogate key column, and you cannot change this behavior, then you have to use the generated by default on null as identity option. This has the downside that the application may pass a value, which might lead to an immediate or delayed ORA-00001: unique constraint violated error.

G-3160: Avoid visible virtual columns.

Blocker

Maintainability, Reliability

Unsupported in db* CODECOP Validators

We cannot identify the type of a column. Requires create table and alter table parser support or access to the Oracle Data Dictionary.

RESTRICTION

Oracle Database 12c

REASON

In contrast to visible columns, invisible columns are not part of a record defined using %rowtype construct. This is helpful as a virtual column may not be programmatically populated. If your virtual column is visible you have to manually define the record types used in API packages to be able to exclude them from being part of the record definition.

Invisible columns may be accessed by explicitly adding them to the column list in a select statement.

EXAMPLE (BAD)

```
r_employee employees%rowtype;
      co_id constant employees.employee_id%type := 107;
3
   begin
4
     r_employee := employee_api.employee_by_id(l_id);
5
6
     r_employee.salary := r_employee.salary * constants_up.small_increase();
7
8
      update employees
9
        set row = r_employee
10
     where employee_id = co_id;
11
   end;
12 /
```

```
1 Error report -
2 ORA-54017: update operation disallowed on virtual columns
3 ORA-06512: at line 9
```

```
1 alter table employees
   add total_salary invisible generated always as
2
3
     (salary + nvl(commission_pct,0) * salary)
4
5
6
   declare
   r_employee employees%rowtype;
7
     co_id constant employees.employee_id%type := 107;
8
9 begin
r_employee.salary := r_employee.salary * constants_up.small_increase();
11
12
   update employees
13
    set row = r_employee
14
15
   where employee_id = co_id;
16 end;
17 /
```

G-3170: Always use DEFAULT ON NULL declarations to assign default values to table columns if you refuse to store **NULL** values.

🏥 Blocker

Reliability

Unsupported in db* CODECOP Validators

We cannot identify column default values. Requires create table and alter table parser support or access to the Oracle Data Dictionary.

RESTRICTION

Oracle Database 12c

REASON

Default values have been nullifiable until Oracle Database 12c. Meaning any tool sending null as a value for a column having a default value bypassed the default value. Starting with Oracle Database 12c default definitions may have an on null definition in addition, which will assign the default value in case of a null value too.

EXAMPLE (BAD)

```
1 create table null_test (
2
    test_case number(2) not null
3 , column_defaulted varchar2(10 char) default 'Default')
4 /
5 insert into null_test(test_case,column_defaulted) values (1,'Value'); -- NOSONAR: G-1050
literal is ok for a standalone insert
6 insert into null_test(test_case,column_defaulted) values (2,default); -- NOSONAR: G-1050
literal is ok for a standalone insert
7 insert into null_test(test_case,column_defaulted) values (3,null); -- NOSONAR: G-1050
literal is ok for a standalone insert
8
9 select test_case, column_defaulted from null_test;
```

```
1 TEST_CASE COLUMN_DEF
2
3
       1 Value
       2 Default
4
5 3
```

```
1 create table null_test (
    test_case number(2) not null
3 , column_defaulted varchar2(10 char) default on null 'Default')
5 insert into null_test(test_case,column_defaulted) values (1,'Value'); -- NOSONAR: G-1050
literal is ok for a standalone insert
6 insert into null_test(test_case,column_defaulted) values (2,default); -- NOSONAR: G-1050
literal is ok for a standalone insert
7 insert into null_test(test_case,column_defaulted) values (3,null); -- NOSONAR: G-1050
literal is ok for a standalone insert
8
9 select test_case, column_defaulted from null_test;
```

1	TEST_CASE COLUMN_DEF	
2		
3	1 Value	
4	2 Default	
5	3 Default	

G-3180: Always specify column names instead of positional references in ORDER BY clauses.

Major

Changeability, Reliability

REASON

If you change your select list afterwards the order by will still work but order your rows differently, when not changing the positional number. Furthermore, it is not comfortable to the readers of the code, if they have to count the columns in the select list to know the way the result is ordered.

EXAMPLE (BAD)

```
select upper(first_name)
, last_name
, salary
, hire_date
from employees
order by 4,1,3;
```

```
select upper(first_name) as first_name
, last_name
, salary
, hire_date
from employees
order by hire_date
, first_name
, salary;
```

G-3182: Always specify column names/aliases instead of positional references in GROUP BY clauses.

🇯 Blocker

Reliability

RESTRICTION

Oracle Database 23c

REASON

If you use a numeric literal in the group by clause in an Oracle Database prior to version 23c, then this literal is not required. It is simply a constant.

Starting with Oracle Database 23c, it is possible to use a literal in the group by clause to refer to a column name or column alias in the select list. However, this only works if the <code>group_by_position_enabled</code> parameter is set to <code>true</code>. In any case, it is not convenient for the readers of the code to have to count the columns in the select list to know how the result is grouped.

Since the meaning of a literal depends on the configuration and database version, the intention is unclear and might lead to an incorrect result.

EXAMPLE (BAD)

```
1 select job_id
, sum(salary) as sum_salary
from employees
4 group by job_id,2
5 order by job_id;
```

```
1 select job_id
2 , sum(salary) as sum_salary
3
    from employees
4 group by job_id
5 order by job_id;
```

G-3183: Always specify column aliases instead of expressions in GROUP BY clauses.

Minor

Maintainability

RESTRICTION

Oracle Database 23c

REASON

Starting with Oracle Database 23c, it is possible to use a column alias in the group by clause instead of repeating the expression used in the select list.

Unless you use rollup, cube or grouping sets, it is not necessary to use expressions in the group by clause.

EXAMPLE (BAD)

```
1 select lower(job_id) as job
, sum(salary) as sum_salary
from employees
group by lower(job_id)
5 order by job;
```

```
1 select lower(job_id) as job
, sum(salary) as sum_salary
from employees
4 group by job
5 order by job;
```

G-3185: Never use ROWNUM at the same query level as ORDER BY.

🇯 Blocker

Reliability, Testability

REASON

The rownum pseudo-column is assigned before the order by clause is used, so using rownum on the same query level as order by will not assign numbers in the desired ordering. Instead you should move the order by into an inline view and use rownum in the outer query.

EXAMPLE (BAD)

```
1
   select first_name
    ,last_name
2
        , salary
3
      ,hire_date
,rownum as salary_rank
4
5
   from employees
6
7 where rownum <= 5 -- violates also G-1050 literal is ok for a standalone query
8 order by salary desc;
```

EXAMPLE (GOOD)

```
select first_name
     , last_name
2
         , salary
3
        , hire_date
4
5
         ,rownum as salary_rank
    from (
6
7
             select first_name
                  ,last_name
8
                  , salary
9
                  ,hire_date
10
11
               from employees
12
              order by salary desc
13
    where rownum <= 5; -- NOSONAR: G-1050 literal is ok for a standalone query
```

EXAMPLE (BEST)

(Assuming you are using Oracle Database 12c or later.)

```
1 select first_name
, last_name
3
        , salary
4
5
        , rank() over (order by salary desc) as salary_rank
    from employees
7 order by salary desc
8 fetch first 5 rows only; -- NOSONAR: G-1050 literal is ok for a standalone query
```

G-3190: Avoid using NATURAL JOIN.

🇯 Blocker

Changeability, Reliability

REASON

A natural join joins tables on equally named columns. This may comfortably fit on first sight, but adding logging columns to a table (changed_by , changed_date) will result in inappropriate join conditions.

EXAMPLE (BAD)

```
1 select d.department_name
  ,e.last_name
2
3
        ,e.first_name
4 from employees e
5 natural join departments d
 order by d.department_name
7
        ,e.last_name;
```

```
1 DEPARTMENT_NAME
                  LAST_NAME
                                FIRST_NAME
 2
3 Accounting
                  Gietz
                                William
4 Executive
                  De Haan
                                Lex
5 ...
```

```
alter table departments add modified_at date default on null sysdate;
1
2
   alter table employees add modified_at date default on null sysdate;
3
4
   select d.department_name
5
     ,e.last_name
6
         ,e.first_name
7
    from employees e
8 natural join departments d
9 order by d.department_name
10
        ,e.last_name;
```

1 No data found

```
select d.department_name
  ,e.last_name
2
       ,e.first_name
3
   from employees e
4
  join departments d
5
on (e.department_id = d.department_id)
  order by d.department_name
7
  ,e.last_name;
8
```

```
1 DEPARTMENT_NAME
                                LAST_NAME
                                                        FIRST_NAME
2
   -----
3
   Accounting
                                                        William
                                Gietz
4
                                De Haan
   Executive
                                                        Lex
5
   . . .
```

G-3195: Always use wildcards in a LIKE clause.

🇯 Blocker

Maintainability

REASON

Using like without at least one wildcard (% or _) is unclear to a maintainer whether a wildcard is forgotten or it is meant as equality test. A common antipattern is also to forget that an underscore is a wildcard, so using like instead of equal can return unwanted rows. If the char datatype is involved, there is also the danger of like not using blank padded comparison where equal will. Depending on use case, you should either remember at least one wildcard or use normal equality operator.

EXAMPLE (BAD)

```
1 select e.employee_id
2
    ,e.last_name
3
    from employees e
4 where e.last_name like 'Smith'; -- violates also G-1050 literal is ok for a standalone query
```

EXAMPLE (GOOD)

Using a wildcard:

```
1 select e.employee_id
2
        ,e.last_name
    from employees e
3
4 where e.last_name like 'Smith%';
```

Change to equality operator instead:

```
1 select e.employee_id
       ,e.last_name
2
3
    from employees e
4 where e.last_name = 'Smith'; -- NOSONAR: G-1050 literal is ok for a standalone query
```

Bulk Operations

G-3210: Always use BULK OPERATIONS (BULK COLLECT, FORALL) whenever you have to execute a DML statement for more than 4 times.

REASON

Context switches between PL/SQL and SQL are extremely costly. BULK Operations reduce the number of switches by passing an array to the SQL engine, which is used to execute the given statements repeatedly.

(Depending on the PLSQL_OPTIMIZE_LEVEL parameter a conversion to BULK COLLECT will be done by the PL/SQL compiler automatically.)

EXAMPLE (BAD)

```
declare
 1
 2
     t_employee_ids employee_api.t_employee_ids_type;
 3
      co_increase constant employees.salary%type
                                                              := 0.1;
       co_department_id constant departments.department_id%type := 10;
 4
 5 begin
 6
      t_employee_ids := employee_api.employee_ids_by_department(
 7
                            id_in => co_department_id
 8
                         );
9
       <<pre><<pre><<pre><<pre><<pre><</pre>
10
       for i in 1..t_employee_ids.count()
11
       loop
12 update employees
            set salary = salary + (salary * co_increase)
13
          where employee_id = t_employee_ids(i);
14
       end loop process_employees;
15
16
    end;
17
```

```
1
   declare
2
     t_employee_ids employee_api.t_employee_ids_type;
3
      co_increase constant employees.salary%type
                                                             := 0.1;
4
       co_department_id constant departments.department_id%type := 10;
5
   beain
6
     t_employee_ids := employee_api.employee_ids_by_department(
7
                           id_in => co_department_id
8
                        );
9
       <<pre><<pre>cess_employees>>
10
       forall i in 1..t_employee_ids.count()
11
       update employees
             set salary = salary + (salary * co_increase)
12
13
          where employee_id = t_employee_ids(i);
   end;
14
15
```

Critical

Reliability, Testability

REASON

Using save exceptions in a forall statement without actually processing the saved exceptions is just wasted work.

If your use of forall is meant to be atomic (all or nothing), don't use save exceptions. If you want to handle errors of individual rows and do use save exceptions, always include an exception handler block with a loop to process the saved exceptions.

EXAMPLE (BAD)

```
declare
2
      t_employee_ids employee_api.t_employee_ids_type;
3
      co_increase
                      constant employees.salary%type
                                                              := 0.1;
      co_department_id constant departments.department_id%type := 10;
4
 5
      e_bulk_errors exception;
6
      pragma exception_init(e_bulk_errors, -24381);
7
8
      t_employee_ids := employee_api.employee_ids_by_department(
9
                            id_in => co_department_id
10
                         );
11
       <<pre><<pre><<pre>cess_employees>>
forall i in 1..t_employee_ids.count() save exceptions
13
          update employees
14
             set salary = salary + (salary * co_increase)
15
           where employee_id = t_employee_ids(i);
16
   end;
17
```

```
1
    declare
2
      t_employee_ids employee_api.t_employee_ids_type;
3
      co_increase constant employees.salary%type
                                                              := 0.1;
      co_department_id constant departments.department_id%type := 10;
4
5
      e_bulk_errors exception;
      pragma exception_init(e_bulk_errors, -24381);
6
7
   begin
8
     t_employee_ids := employee_api.employee_ids_by_department(
9
                            id_in => co_department_id
10
                         );
       <<pre><<pre>cess_employees>>
11
       forall i in 1..t_employee_ids.count() save exceptions
12
13
          update employees
             set salary = salary + (salary * co_increase)
14
15
           where employee_id = t_employee_ids(i);
16
   exception
17
       when e_bulk_errors then
18
          <<handle_bulk_exceptions>>
19
          for i in 1..sql%bulk_exceptions.count
20
21
            logger.log(sql%bulk_exceptions(i).error_code);
22
         end loop handle_bulk_exceptions;
23
   end:
24
```

Transaction Control

G-3310: Never commit within a cursor loop.

Blocker

Efficiency, Reliability

REASON

Doing frequent commits within a cursor loop (all types of loops over cursors, whether implicit cursor for loop or loop with explicit fetch from cursor or cursor variable) risks not being able to complete due to ORA-01555, gives bad performance, and risks that the work is left in an unknown half-finished state and cannot be restarted.

- If the work belongs together (an atomic transaction) the commit should be moved to after the loop. Or even better if the logic can be rewritten to a single DML statement on all relevant rows instead of a loop, committing after the single statement.
- If each loop iteration is a self-contained atomic transaction, consider instead to populate a collection of transactions to be done (taking restartability into account by collection population), loop over that collection (instead of looping over a cursor) and call a procedure (that contains the transaction logic and the commit) in the loop (see also G-3320).

EXAMPLE (BAD)

```
1
   declare
2
      l_counter
                                                          := 0;
                       integer
3
      l_discount
                       discount.percentage%type;
      co_status_new constant orders.order_status%type := 'New';
4
5
      co_commit_interval constant integer
                                                         := 100;
6
      <<new_orders>>
7
8
      for r_order in (
9
        select o.order_id, o.customer_id
10
           from orders o
          where o.order_status = co_status_new
11
12
13
       loop
         l_discount := sales_api.calculate_discount(p_customer_id => r_order.customer_id);
14
15
        update order_lines ol -- NOSONAR: violates G-3210
16
17
           set ol.discount = l_discount
          where ol.order_id = r_order.order_id;
18
19
         l_counter := l_counter + 1;
20
          if l_counter = co_commit_interval then
21
       commit;
22
23
           1_{counter} := 0;
24
         end if:
25
       end loop new_orders;
26
       if l_counter > 0 then
27
         commit:
28
       end if:
29
    end;
30
```

```
1
    declare
 2
      l_discount discount.percentage%type;
 3
       co_status_new constant orders.order_status%type := 'New';
 4
   begin
 5
    <<new_orders>>
 6
      for r_order in (
 7
       select o.order_id,o.customer_id
8
           from orders o
9
          where o.order_status = co_status_new
10
      )
11
     loop
12
       l_discount := sales_api.calculate_discount(p_customer_id => r_order.customer_id);
13
14
       update order_lines ol -- NOSONAR: violates G-3210
15
           set ol.discount = l_discount
16
          where ol.order_id = r_order.order_id;
17
       end loop new_orders;
18
19
       commit;
20 end;
21 /
```

EXAMPLE (BEST)

(Assuming suitable foreign key relationship exists to allow updating a join.)

```
1 declare
2
      co_status_new constant orders.order_status%type := 'New';
3 begin
     update (
4
5
                select o.customer_id,ol.discount
6
                  from orders o
7
                  join order_lines ol
8
                   on ol.order_id = o.order_id
9
                 where o.order_status = co_status_new
10
11
          set discount = sales_api.calculate_discount(p_customer_id => customer_id);
12
13 commit;
14 end;
15
```

Maintainability, Reusability, Testability

REASON

Commit inside a non-cursor loop (other loop types than loops over cursors - see also G-3310) is either a self-contained atomic transaction, or it is a chunk (with suitable restartability handling) of very large data manipulations. In either case encapsulating the transaction in a procedure is good modularity, enabling reuse and testing of a single call.

EXAMPLE (BAD)

```
1
    declare
 2
      co_upper_bound constant integer
                                                          := 5;
 3
      co_max_level constant integer
                                                         := 3;
      co_number constant types_up.short_string := 'Number';
co_line constant types_up.short_string := 'Line';
co_space constant types_up.short_string := '';
l_counter integer := 0;
 4
 5
 6
7
8 begin
9
       <<create_headers>>
10 loop
11
      insert into headers (id,text)
          values (
12
13
           l_counter,co_number
14
             || co_space
15
             || 1_counter
          );

30
      for l_counter in 1..co_upper_bound
31
32
     create_rows(l_counter);
33
      end loop create_headers;
34
   end;
35 /
```

🇯 Blocker

Reliability, Testability

REASON

Before we take a look at how autonomous transactions work, I'd like to emphasize that this type of transaction is a powerful and therefore dangerous tool when used improperly. The true need for an autonomous transaction is very rare indeed. I would be very suspicious of any code that makes use of them-that code would get extra examination. It is far too easy to accidentally introduce logical data integrity issues into a system using them. (page 300)

In my experience, that is the only truly valid use of an autonomous transaction-to log errors or informational messages in a manner that can be committed independently of the parent transaction. (page 305)

- Kyte, Thomas (2013). Expert Oracle Database Architecture. Third Edition. Apress.

It is most likely not possible to distinguish legitimate uses of autonomous transactions from illegitimate ones via static code analysis. However, since we expect exactly one autonomous transaction per application, the number of false positives is manageable.

EXAMPLE (BAD)

```
procedure ins_dept(in_dept_row in dept%rowtype) is
pragma autonomous transaction:
    begin
4
5
          insert into dept
6
           values in_dept_row;
7
          commit; -- required by autonomous transaction
8
      end ins_dept;
9
    end dept_api;
10
```

```
create or replace package body dept_api is
2
      procedure ins_dept(in_dept_row in dept%rowtype) is
3
      begin
      insert into dept
4
5
          values in_dept_row;
6
          -- transaction is committed in calling module
7
          -- after the completion of the unit of work
8
      end ins_dept;
9
   end dept_api;
10 /
```

Control Structures

CURSOR

G-4110: Always use %NOTFOUND instead of NOT %FOUND to check whether a cursor returned data.

Minor

Maintainability

REASON

The readability of your code will be higher when you avoid negative sentences.

EXAMPLE (BAD)

```
1 declare
2
     cursor c_employees is
 3
         select *
           from employees
 5
          order by employee_id;
7
       type t_employees_type is table of c_employees%rowtype;
8
       t_employees t_employees_type;
9
       co_bulk_size constant simple_integer := 10;
10 begin
11
       open c_employees;
12
13
       <<pre><<pre><<pre>cess_employees>>
14
      loop
15
          fetch c_employees bulk collect into t_employees limit co_bulk_size;
16
17
          <<display_employees>>
18
          for i in 1..t_employees.count()
19
20
             sys.dbms_output.put_line(t_employees(i).last_name);
21
          end loop display_employees;
22
23
          exit process_employees when not c_employees%found;
24
       end loop process_employees;
25
26
       close c_employees;
27
    end;
28
```

```
1
    declare
 2
    cursor c_employees is
 3
       select *
 4
           from employees
 5
          order by employee_id;
 6
 7
       type t_employees_type is table of c_employees%rowtype;
8
       t_employees t_employees_type;
9
       co_bulk_size constant simple_integer := 10;
10 begin
11
       open c_employees;
12
13
       <<pre><<pre><<pre>cess_employees>>
14
       loop
15
          fetch c_employees bulk collect into t_employees limit co_bulk_size;
16
17
          <<display_employees>>
18
          for i in 1..t_employees.count()
19
          loop
20
             sys.dbms_output.put_line(t_employees(i).last_name);
21
         end loop display_employees;
22
23
          exit process_employees when c_employees%notfound;
24
       end loop process_employees;
25
26
       close c_employees;
27 end;
28 /
```

G-4120: Avoid using %NOTFOUND directly after the FETCH when working with BULK OPERATIONS and LIMIT clause.

🇯 Blocker

Reliability

REASON

%notfound is set to true as soon as less than the number of rows defined by the limit clause has been read.

EXAMPLE (BAD)

The employees table holds 107 rows. The example below will only show 100 rows as the cursor attribute not found is set to true as soon as the number of rows to be fetched defined by the limit clause is not fulfilled anymore.

```
declare
2
      cursor c_employees is
3
         select *
4
            from employees
5
           order by employee_id;
6
7
        type t_employees_type is table of c_employees%rowtype;
8
        t_employees t_employees_type;
9
        co_bulk_size constant simple_integer := 10;
10 begin
11
       open c_employees;
12
13
       <<pre><<pre><<pre>cess_employees>>
14
15
          fetch c_employees bulk collect into t_employees limit co_bulk_size;
16
          exit process_employees when c_employees%notfound;
17
18
          <<display_employees>>
19
           for i in 1..t_employees.count()
20
21
             sys.dbms_output.put_line(t_employees(i).last_name);
22
          end loop display_employees;
23
       end loop process_employees;
24
25
       close c_employees;
26
    end;
27
```

EXAMPLE (BETTER)

This example will show all 107 rows but execute one fetch too much (12 instead of 11).

```
1
     declare
 2
     cursor c_employees is
 3
         select *
 4
           from employees
 5
           order by employee_id;
 6
 7
       type t_employees_type is table of c_employees%rowtype;
8
        t_employees t_employees_type;
9
        co_bulk_size constant simple_integer := 10;
10
    begin
11
       open c_employees;
12
13
       <<pre><<pre><<pre>cess_employees>>
14
       loop
15
          fetch c_employees bulk collect into t_employees limit co_bulk_size;
         exit process_employees when t_employees.count() = 0;
16
          <<display_employees>>
17
          for i in 1..t_employees.count()
18
19
20
             sys.dbms_output.put_line(t_employees(i).last_name);
21
          end loop display_employees;
22
       end loop process_employees;
23
24
       close c_employees;
25
    end;
26
```

EXAMPLE (GOOD)

This example does the trick (11 fetches only to process all rows)

```
1
    declare
 2
      cursor c_employees is
 3
         select *
 4
            from employees
 5
           order by employee_id;
 6
        type t_employees_type is table of c_employees%rowtype;
 7
        t_employees t_employees_type;
8
9
        co_bulk_size constant simple_integer := 10;
10 begin
11
       open c_employees;
12
       <<pre><<pre><<pre>cess_employees>>
13
14
       loop
          fetch c_employees bulk collect into t_employees limit co_bulk_size;
15
16
           <<display_employees>>
17
          for i in 1..t_employees.count()
18
          loop
19
              sys.dbms_output.put_line(t_employees(i).last_name);
20
           end loop display_employees;
           exit process_employees when t_employees.count() <> co_bulk_size;
21
22
        end loop process_employees;
23
24
        close c_employees;
25
     end;
26
```

Blocker

Efficiency, Reliability

REASON

Any cursors left open can consume additional memory space (i.e. SGA) within the database instance, potentially in both the shared and private SQL pools. Furthermore, failure to explicitly close cursors may also cause the owning session to exceed its maximum limit of open cursors (as specified by the open_cursors database initialization parameter), potentially resulting in the Oracle Database error of "ORA-01000: maximum open cursors exceeded".

EXAMPLE (BAD)

```
create or replace package body employee_api as
2
       function department_salary(in_dept_id in integer) -- NOSONAR: non-deterministic
3
         return number is
          cursor c_department_salary(p_dept_id in departments.department_id%type) is
4
5
            select sum(salary) as sum_salary
6
               from employees
7
              where department_id = p_dept_id;
8
          r_department_salary c_department_salary%rowtype;
9
          co_dept_id
                              constant departments.department_id%type := in_dept_id;
10
       begin
      open c_department_salary(p_dept_id => co_dept_id);
11
12
          fetch c_department_salary into r_department_salary;
13
          return r_department_salary.sum_salary;
14
15
       end department_salary;
16
    end employee_api;
17
```

```
create or replace package body employee_api as
2
      function department_salary(in_dept_id in integer) -- NOSONAR: non-deterministic
3
         return number is
4
          cursor c_department_salary(p_dept_id in departments.department_id%type) is
5
            select sum(salary) as sum_salary
6
               from employees
7
              where department_id = p_dept_id;
8
          r_department_salary c_department_salary%rowtype;
9
          co_dept_id
                              constant departments.department_id%type := in_dept_id;
10
       begin
11
         open c_department_salary(p_dept_id => co_dept_id);
12
          fetch c_department_salary into r_department_salary;
13
          close c_department_salary;
14
          return r_department_salary.sum_salary;
15
       end department_salary;
16
    end employee_api;
17
```

G-4140: Avoid executing any statements between a SQL operation and the usage of an implicit cursor attribute.

REASON

The Oracle Database provides a variety of cursor attributes (like %found and %rowcount) that can be used to obtain information about the status of a cursor, either implicit or explicit.

You should avoid inserting any statements between the cursor operation and the use of an attribute against that cursor. Interposing such a statement can affect the value returned by the attribute, thereby potentially corrupting the logic of your program.

In the following example, a procedure call is inserted between the delete statement and a check for the value of sql%rowcount, which returns the number of rows modified by that last SQL statement executed in the session. If this procedure includes a commit / rollback or another implicit cursor the value of sql%rowcount is affected.

EXAMPLE (BAD)

```
create or replace package body employee_api as
2
       co_one constant simple_integer := 1;
       co_msg constant types_up.text := 'Do something based on ';
3
4
5
       procedure process_dept(in_dept_id in departments.department_id%type) is
6
          co_dept_id constant departments.department_id%type := in_dept_id;
7
8
          sys.dbms_output.put_line(co_msg || co_dept_id);
9
       end process_dept;
10
       procedure remove_employee(in_employee_id in employees.employee_id%type) is
11
          co_employee_id constant departments.department_id%type := in_employee_id;
12
                         employees.department_id%type;
13
          l_dept_id
14
       begin
          delete from employees
15
           where employee_id = co_employee_id
16
        returning department_id into l_dept_id;
17
18
19
          process_dept(in_dept_id => l_dept_id);
20
21
          if sql%rowcount > co_one then
22
              -- too many rows deleted.
23
             rollback;
24
          end if;
25
       end remove_employee;
26
    end employee_api;
27
```

```
1
    create or replace package body employee_api as
 2
       co_one constant simple_integer := 1;
 3
       co_msg constant types_up.text := 'Do something based on ';
 4
 5
       procedure process_dept(in_dept_id in departments.department_id%type) is
 6
          co_dept_id constant departments.department_id%type := in_dept_id;
 7
       begin
          sys.dbms_output.put_line(co_msg || co_dept_id);
8
9
       end process_dept;
10
11
       procedure remove_employee(in_employee_id in employees.employee_id%type) is
12
          co_employee_id constant departments.department_id%type := in_employee_id;
13
          l_dept_id
                      employees.department_id%type;
14
          l_deleted_emps simple_integer;
15
       begin
16
         delete from employees
17
          where employee_id = co_employee_id
18
       returning department_id into l_dept_id;
19
20
          1_deleted_emps := sq1%rowcount;
21
22
          process_dept(in_dept_id => l_dept_id);
23
24
          if l_deleted_emps > co_one then
25
             -- too many rows deleted.
26
             rollback;
27
          end if;
28
       end remove_employee;
29
    end employee_api;
30
```

CASE / IF / DECODE / NVL / NVL2 / COALESCE

G-4210: Try to use CASE rather than an IF statement with multiple ELSIF paths.

Minor

Maintainability, Testability

REASON

if statements containing multiple elsif tend to become complex quickly.

EXAMPLE (BAD)

```
1 declare
2
      l_color types_up.color_code_type;
3 begin
      if l_color = constants_up.co_red then
4
5
         my_package.do_red();
     elsif 1_color = constants_up.co_blue then
6
7
         my_package.do_blue();
     elsif l_color = constants_up.co_black then
8
9
         my_package.do_black();
10
     end if;
11
   end;
12
```

```
1 declare
2
      1_color types_up.color_code_type;
3 begin
     case l_color
4
5
        when constants_up.co_red then
6
           my_package.do_red();
7
        when constants_up.co_blue then
8
           my_package.do_blue();
9
        when constants_up.co_black then
10
           my_package.do_black();
11
      end case;
12 end;
13
```

Maintainability, Portability

REASON

decode is an Oracle Database specific function hard to understand and restricted to SQL only. The "newer" case function is much more common, has a better readability and may be used within PL/SQL too. Be careful that decode can handle null values, which the simple case cannot - for such cases you must use the searched case and is null instead.

EXAMPLE (BAD)

```
-- @formatter:off
select decode(ctry.country_code, constants_up.co_ctry_uk, constants_up.co_lang_english
, constants_up.co_ctry_fr, constants_up.co_lang_french
, constants_up.co_ctry_de, constants_up.co_lang_german

constants_up.co_lang_not_supported)
from countries ctry;
```

null values can be compared in decode:

EXAMPLE (GOOD)

```
select case ctry.country_code
2
              when constants_up.co_ctry_uk then
3
                 constants_up.co_lang_english
4
              when constants_up.co_ctry_fr then
5
                 constants_up.co_lang_french
6
              when constants_up.co_ctry_de then
7
                 constants_up.co_lang_german
8
9
                  constants_up.co_lang_not_supported
10
           end
11
      from countries ctry;
```

Simple case can not compare null values, instead the searched case expression must be used:

```
1
   select case
2
     when ctry.country_code = constants_up.co_ctry_uk then
3
               constants_up.co_lang_english
            when ctry.country_code = constants_up.co_ctry_fr then
4
5
               constants_up.co_lang_french
6
             when ctry.country_code is null then
7
                 constants_up.co_lang_unknown
8
              else
9
                 \verb|constants_up.co_lang_not_supported|\\
10
           end
11
      from countries ctry;
```

G-4230: Always use a COALESCE instead of a NVL command, if parameter 2 of the NVL function is a function call or a SELECT statement.

Critical

Efficiency, Reliability

REASON

The nv1 function always evaluates both parameters before deciding which one to use. This can be harmful if parameter 2 is either a function call or a select statement, as it will be executed regardless of whether parameter 1 contains a null value or not.

The coalesce function does not have this drawback.

EXAMPLE (BAD)

```
1 select nvl(dummy, my_package.expensive_null(value_in => dummy))
2 from dual;
```

```
1  select coalesce(dummy, my_package.expensive_null(value_in => dummy))
2  from dual;
```

G-4240: Always use a CASE instead of a NVL2 command if parameter 2 or 3 of NVL2 is either a function call or a SELECT statement.

Efficiency, Reliability

REASON

The nv12 function always evaluates all parameters before deciding which one to use. This can be harmful, if parameter 2 or 3 is either a function call or a select statement, as they will be executed regardless of whether parameter 1 contains a null value or not.

EXAMPLE (BAD)

```
select nvl2(dummy, my_package.expensive_nn(value_in => dummy)
, my_package.expensive_null(value_in => dummy))
from dual;
```

🏥 Blocker

Maintainability, Reliability, Testability

REASON

Conditions are evaluated top to bottom in branches of a case statement or chain of if/elsif statements. The first condition to evaluate as true leads to that branch being executed, the rest will never execute. Having an identical duplicated condition in another branch will never be reached and will be dead code.

EXAMPLE (BAD)

```
1
   declare
2
     1_color types_up.color_code_type;
3
   begin
    case l_color
4
5
      when constants_up.co_red then
6
          my_package.do_red();
7
       when constants_up.co_blue then
8
          my_package.do_blue();
   when constants_up.co_red then -- never reached
9
my_package.do_black(); -- dead code
    else
11
12
         null;
13
    end case;
14
   end;
15 /
```

```
declare
2
     1_color types_up.color_code_type;
3
   begin
     case l_color
4
5
       when constants_up.co_red then
6
           my_package.do_red();
7
        when constants_up.co_blue then
8
           my_package.do_blue();
   when constants_up.co_black then
9
10
          my_package.do_black();
     else
11
12
           null;
13
      end case;
14
   end;
15 /
```

G-4260: Avoid inverting boolean conditions with NOT.

Minor

Maintainability, Testability

REASON

It is more readable to use the opposite comparison operator instead of inverting the comparison with not.

EXAMPLE (BAD)

```
1 declare
2
  1_color types_up.color_code_type;
3 begin
if not l_color != constants_up.co_red then
5
       my_package.do_red();
  end if;
6
7 end;
8
```

```
1 declare
  1_color types_up.color_code_type;
2
3 begin
4 if l_color = constants_up.co_red then
5
     my_package.do_red();
   end if;
6
7 end;
8
```

Minor

Maintainability, Testability

REASON

It is more readable to simply use the boolean value as a condition itself, rather than use a comparison condition comparing the boolean value to the literals true or false.

EXAMPLE (BAD)

```
declare
    co_string constant types_up.text := '42';
    l_is_valid boolean;

begin
    l_is_valid := my_package.is_valid_number(co_string);

if l_is_valid = true then
    my_package.convert_number(l_string);

end if;
end;

//
```

```
declare
    co_string constant types_up.text := '42';
    l_is_valid boolean;

begin
    l_is_valid := my_package.is_valid_number(co_string);

if l_is_valid then
    my_package.convert_number(l_string);

end if;
end;
//
```

G-4310: Never use GOTO statements in your code.

Major

Maintainability, Testability

REASON

Code containing gotos is hard to format. Indentation should be used to show logical structure, and gotos have an effect on logical structure. Using indentation to show the logical structure of a goto and its target, however, is difficult or impossible. (...)

Use of gotos is a matter of religion. My dogma is that in modern languages, you can easily replace nine out of ten gotos with equivalent sequential constructs. In these simple cases, you should replace gotos out of habit. In the hard cases, you can still exorcise the goto in nine out of ten cases: You can break the code into smaller routines, use try-finally, use nested ifs, test and retest a status variable, or restructure a conditional. Eliminating the goto is harder in these cases, but it's good mental exercise (...).

-- McConnell, Steve C. (2004). Code Complete. Second Edition. Microsoft Press.

EXAMPLE (BAD)

```
create or replace package body my_package is
2
     procedure password_check(in_password in varchar2) is
3
         co_password constant dba_users.password%type := in_password;
         co_digitarray constant string(10 char) := '0123456789';
4
                                                       := 1;
5
         co_lower_bound constant simple_integer
6
         co_errno constant simple_integer
                                                       := -20501;
                       constant string(100 char)

     <<while_loop>>
9 while (i <= co_max_value)
    loop
10
11
      i := i + co_increment;
12 end loop while_loop;
13
14
      <<basic_loop>>
15
       loop
16
       exit basic_loop when true;
17
      end loop basic_loop;
18
      <<for_loop>>
19
20
       for i in co_min_value..co_max_value
21
22
       sys.dbms_output.put_line(i);
23 end loop for_loop;
24
25
      <<pre><<pre><<pre>cess_employees>>
       for r_employee in (select last_name from employees)
26
27
28
         sys.dbms_output.put_line(r_employee.last_name);
29
       end loop process_employees;
30 end;
31 /
```

Maintainability, Reliability, Testability

REASON

Reusing labels inside the scope of another label with the same name leads to confusion, less chance of understanding the code, and could lead to bugs (for example if using exit my_label exits at a different nesting level than expected.)

EXAMPLE (BAD)

```
1 <<my_label>>
2 declare
3
     co_min_value constant simple_integer := 1;
4
     co_max_value constant simple_integer := 8;
5 begin
6 <<my_label>>
7
     for i in co_min_value..co_max_value
8
9
         sys.dbms_output.put_line(i);
10
     end loop my_label;
11 end my_label;
12 /
```

```
1 <<output_values>>
2 declare
3
     co_min_value constant simple_integer := 1;
4
      co_max_value constant simple_integer := 8;
5 begin
6 <<pre><<pre><<pre><<pre>6
7
      for i in co_min_value..co_max_value
8
9
          sys.dbms_output.put_line(i);
10
     end loop process_values;
11 end output_values;
12
```

G-4330: Always use a CURSOR FOR loop to process the complete cursor results unless you are using bulk operations.

Major

Maintainability

REASON

It is easier for the reader to see, that the complete data set is processed. Using SQL to define the data to be processed is easier to maintain and typically faster than using conditional processing within the loop.

Since an exit statement is similar to a goto statement, it should be avoided, whenever possible.

EXAMPLE (BAD)

```
1
   declare
     cursor c_employees is
2
      select employee_id,last_name
3
          from employees;
5
     r_employee c_employees%rowtype;
6 begin
7
      open c_employees;
8
9
      <<read_employees>>
10 loop
11     fetch c_employees into r_employee;
      exit read_employees when c_employees%notfound;
12
13
         sys.dbms_output.put_line(r_employee.last_name);
14
     end loop read_employees;
15
16
       close c_employees;
17 end;
18
```

```
1 declare
2
     cursor c_employees is
       select employee_id,last_name
3
4
          from employees;
5 begin
6
      <<read_employees>>
7
     for r_employee in c_employees
8 loop
9
         sys.dbms_output.put_line(r_employee.last_name);
10
     end loop read_employees;
11 end;
12
```

Maintainability

REASON

It is easier for the reader to see, that the complete array is processed.

Since an exit statement is similar to a goto statement, it should be avoided, whenever possible.

Please note that:

- · Varrays are always dense
- · Associative arrays (or index-by tables) are either dense or sparse
- Nested tables start dense and may become sparse

EXAMPLE (BAD)

```
declare
2
       type t_employee_type is varray(10) of employees.employee_id%type;
       t_employees t_employee_type;
co_himuro constant integer
3
4
                                               := 118;
       co_livingston constant integer
5
                                               := 177;
6
       co_min_value constant simple_integer := 1;
7
       co_increment constant simple_integer := 1;
8
                      pls_integer;
       i
9
    begin
10
       t_employees := t_employee_type(co_himuro,co_livingston);
11
          := co_min_value;
12
13
       <<pre><<pre><<pre>cess_employees>>
14
     exit process_employees when i > t_employees.count();
15
           sys.dbms_output.put_line(t_employees(i));
16
17
          i := i + co_increment;
18
       end loop process_employees;
19
    end;
20
```

```
declare
2
       type t_employee_type is varray(10) of employees.employee_id%type;
3
       t_employees t_employee_type;
4
       co_himuro
                     constant integer := 118;
5
       co_livingston constant integer := 177;
6
    begin
7
       t_employees := t_employee_type(co_himuro,co_livingston);
8
9
        <<pre><<pre>cess_employees>>
10
       for i in 1..t_employees.count()
11
          sys.dbms_output.put_line(t_employees(i));
12
13
       end loop process_employees;
14
    end;
15
```

G-4350: Always use 1 as lower and COUNT() as upper bound when looping through a dense array.

🇯 Blocker

Reliability

REASON

Doing so will not raise a value_error if the array you are looping through is empty. If you want to use first()..last() you need to check the array for emptiness beforehand to avoid the raise of value_error.

Please note that:

- Varrays are always dense
- · Associative arrays (or index-by tables) are either dense or sparse
- · Nested tables start dense and may become sparse

EXAMPLE (BAD)

```
1
    declare
    type t_employee_type is table of employees.employee_id%type;
2
3
       t_employees t_employee_type := t_employee_type();
4 begin
5
       <<pre><<pre><<pre><<pre><<pre><</pre>
6
     for i in t_employees.first()..t_employees.last()
7
8
          sys.dbms_output.put_line(t_employees(i)); -- some processing
9
       end loop process_employees;
10 end;
11 /
```

EXAMPLE (BETTER)

Raise an unitialized collection error if t_employees is not initialized.

```
1
    declare
2
       type t_employee_type is table of employees.employee_id%type;
3
       t_employees t_employee_type := t_employee_type();
4 begin
5
       <<pre><<pre>cess_employees>>
for i in 1..t_employees.count()
7
          sys.dbms_output.put_line(t_employees(i)); -- some processing
8
9
       end loop process_employees;
10 end;
11 /
```

EXAMPLE (GOOD)

Raises neither an error nor checking whether the array is empty. t_employees.count() always returns a number (unless the array is not initialized). If the array is empty count() returns 0 and therefore the loop will not be entered.

```
1
    declare
   type t_employee_type is table of employees.employee_id%type;
 2
 3
       t_employees t_employee_type := t_employee_type();
 4 begin
 5 if t_employees is not null then
 6
         <<pre><<pre><<pre><<pre><<pre><>>
 7
        for i in 1..t_employees.count()
8
9
            sys.dbms_output.put_line(t_employees(i)); -- some processing
10
         end loop process_employees;
       end if;
11
12 end;
13 /
```

G-4360: Always use a WHILE loop to process a loose array.

Critical

Efficiency

REASON

When a loose (also called sparse) array is processed using a numeric for loop we have to check with all iterations whether the element exist to avoid a no_data_found exception. In addition, the number of iterations is not driven by the number of elements in the array but by the number of the lowest/highest element. The more gaps we have, the more superfluous iterations will be done.

Please note that:

- · Varrays are always dense
- · Associative arrays (or index-by tables) are either dense or sparse
- Nested tables start dense and may become sparse

EXAMPLE (BAD)

```
declare -- raises no_data_found when processing 2nd record
      type t_employee_type is table of employees.employee_id%type;
3
      t_employees t_employee_type;
     4
5
     co_mcewen constant integer := 158;
6
7
      co_index_matos constant integer := 2;
8 begin
9
      t_employees := t_employee_type(co_rogers, co_matos, co_mcewen);
10
      t_employees.delete(co_index_matos);
11
12
      if t_employees is not null then
13
         <<pre><<pre><<pre>cess_employees>>
for i in 1..t_employees.count()
15
16
            sys.dbms_output.put_line(t_employees(i));
17
         end loop process_employees;
18
       end if;
19
    end;
20
```

```
1
    declare
 type t_employee_type is table of employees.employee_id%type;
      t_employees t_employee_type;
co_rogers constant integer := 134;
co_matos constant integer := 143;
co_mcewen constant integer := 158;
 3
 4
 5
 6
     co_index_matos constant integer := 2;
 7
 8
       l_index pls_integer;
9 begin
10
        t_employees := t_employee_type(co_rogers, co_matos, co_mcewen);
11
        t_employees.delete(co_index_matos);
12
13
        l_index := t_employees.first();
14
15
        <<pre><<pre><<pre>cess_employees>>
16
        while l_index is not null
17
18
           sys.dbms_output.put_line(t_employees(l_index));
19
           l_index := t_employees.next(l_index);
20
        end loop process_employees;
21 end;
22 /
```

Maintainability, Testability

REASON

An unconditional continue is either redundant (a continue as the last statement before the end of the loop) or causes dead code. An unconditional exit causes no looping and may cause dead code as well. If continue or exit is needed, it should always have a condition.

EXAMPLE (BAD)

```
1
    begin
2
       <<pre><<pre><<pre>cess_employees>>
3
      loop
4
         my_package.some_processing();
5
6
   continue process_employees;
7
8
          my_package.some_further_processing(); -- Dead code
9
       end loop process_employees;
10
   end:
11
```

```
declare
2
       co_first_year constant pls_integer := 1900;
3
   begin
4
       <<pre><<pre><<pre>cess_employees>>
5
       loop
6
          my_package.some_processing();
7
8
   continue process_employees when extract(year from sysdate) > co_first_year;
9
10
          my_package.some_further_processing();
11
       end loop process_employees;
12
    end;
13
```

Maintainability

REASON

A numeric for loop as well as a while loop and a cursor for loop have defined loop boundaries. If you are not able to exit your loop using those loop boundaries, then a basic loop is the right loop to choose.

EXAMPLE (BAD)

```
1
    declare
2
      i
                   integer;
3
       co_min_value constant simple_integer := 1;
4
       co_max_value constant simple_integer := 10;
5
       co_increment constant simple_integer := 1;
6
  begin
7
       i := co_min_value;
8
       <<while_loop>>
9 while (i <= co_max_value)</pre>
10
11
          i := i + co_increment;
12
         exit while_loop when i > co_max_value;
13
       end loop while_loop;
14
15
       <<basic_loop>>
16
       loop
17
         exit basic_loop when true;
18
       end loop basic_loop;
19
20
       <<for_loop>>
21
       for i in co_min_value..co_max_value
22
       loop
23
24
         exit for_loop when i = co_max_value;
25
       end loop for_loop;
26
27
       <<pre><<pre>cess_employees>>
28
       for r_employee in (
29
          select last_name
30
            from employees
31
32
       loop
33
          sys.dbms_output.put_line(r_employee.last_name);
          null; -- some processing
34
35
          exit process_employees when true;
36
       end loop process_employees;
37
    end;
38
```

```
1
    declare
    i
2
                  integer;
3
      co_min_value constant simple_integer := 1;
4
       co_max_value constant simple_integer := 10;
 5
       co_increment constant simple_integer := 1;
 6 begin
 7
    i := co_min_value;
8
       <<while_loop>>
9 while (i <= co_max_value)</pre>
10
       loop
11
       i := i + co_increment;
12
       end loop while_loop;
13
14
       <<basic_loop>>
15
       loop
16
       exit basic_loop when true;
17
       end loop basic_loop;
18
19
       <<for_loop>>
20
       for i in co_min_value..co_max_value
21
       loop
22
       sys.dbms_output.put_line(i);
23
       end loop for_loop;
24
25
       <<pre><<pre><<pre>cess_employees>>
26
       for r_employee in (
27
       select last_name
28
          from employees
       )
29
30
       loop
31
         sys.dbms_output.put_line(r_employee.last_name); -- some processing
32
       end loop process_employees;
33 end;
34 /
```

Minor

Maintainability

REASON

If you need to use an exit statement use its full semantic to make the code easier to understand and maintain. There is simply no need for an additional if statement.

EXAMPLE (BAD)

```
1
    declare
2
       co_first_year constant pls_integer := 1900;
3
   begin
4
       <<pre><<pre><<pre><<pre><<pre><</pre>
5
6
           my_package.some_processing();
7
8
           if extract(year from sysdate) > co_first_year then
9
              exit process_employees; -- violates also G-4365
10
           end if;
11
12
           my_package.some_further_processing();
13
        end loop process_employees;
14
    end;
15
```

```
1
    declare
2
       co_first_year constant pls_integer := 1900;
3
4
        <<pre><<pre><<pre>cess_employees>>
5
        loop
6
           my_package.some_processing();
7
8
           exit process_employees when extract(year from sysdate) > co_first_year;
9
10
           my_package.some_further_processing();
11
        end loop process_employees;
12
    end;
13
```

Minor

Maintainability

REASON

It's a good alternative for comments, especially for nested loops to name the loop to exit.

EXAMPLE (BAD)

```
declare
 2
       co_init_loop constant simple_integer
                                                         := 0;
       co_increment constant simple_integer
 3
                                                         := 1;
 4
       co_exit_value constant simple_integer
                                                         := 3;
       co_outer_text constant types_up.short_text_type := 'Outer Loop counter is ';
 5
       co_inner_text constant types_up.short_text_type := ' Inner Loop counter is ';
 6
        1_outerlp pls_integer;
1_innerlp pls_integer;
 7
8
       l_innerlp
9
    begin
10
        l_outerlp := co_init_loop;
11
        <<outerloop>>
12
        loop
           l_innerlp := co_init_loop;
13
           1_outerlp := nvl(1_outerlp,co_init_loop) + co_increment;
14
15
           <<innerloop>>
16
           loop
17
             l_innerlp := nvl(l_innerlp,co_init_loop) + co_increment;
18
              sys.dbms_output.put_line(co_outer_text
                 || l_outerlp
19
                 || co_inner_text
20
21
                 || l_innerlp);
22
              exit when l_innerlp = co_exit_value;
23
24
           end loop innerloop;
25
           exit when l_innerlp = co_exit_value;
26
27
        end loop outerloop;
28
    end;
29
    /
```

```
declare
1
   2
3
4
     co_outer_text constant types_up.short_text_type := 'Outer Loop counter is ';
5
     co_inner_text constant types_up.short_text_type := ' Inner Loop counter is ';
 6
7
      l_outerlp pls_integer;
8
      l_innerlp pls_integer;
9 begin
      l_outerlp := co_init_loop;
10
11
      <<outerloop>>
12
      loop
13
         l_innerlp := co_init_loop;
14
         1_outerlp := nvl(1_outerlp,co_init_loop) + co_increment;
15
         <<innerloop>>
16
        loop
17
           l_innerlp := nvl(l_innerlp,co_init_loop) + co_increment;
18
            sys.dbms_output.put_line(co_outer_text
19
              || l_outerlp
20
              || co_inner_text
21
              || l_innerlp);
22
23
           exit outerloop when l_innerlp = co_exit_value;
         end loop innerloop;
24
25
       end loop outerloop;
26 end;
27 /
```

G-4385: Never use a cursor for loop to check whether a cursor returns data.

Efficiency

REASON

You might process more data than required, which leads to bad performance.

EXAMPLE (BAD)

```
declare
2
      l_employee_found boolean := false;
3
      cursor c_employees is
         select employee_id,last_name
4
5
           from employees;
6 begin
7
      <<check_employees>>
8
      for r_employee in c_employees
9
      loop
10
       1_employee_found := true;
   end loop check_employees;
11
      if l_employee_found then
12
       null; -- some processing;
13
14
       end if;
15
   end;
16
```

```
1
    declare
 2
      l_employee_found boolean := false;
 3
      cursor c_employees is
         select employee_id,last_name
 4
 5
           from employees;
 6
      r_employee
                       c_employees%rowtype;
7 begin
8
      open c_employees;
9
       fetch c_employees into r_employee;
      1_employee_found := c_employees%found;
10
   close c_employees;
11
       if l_employee_found then
12
        null; -- some processing;
13
14
       end if;
15 end;
16
```

G-4387: Never use a FOR LOOP for a query that should return not more than one row.

Reliability, Efficiency, Readability

★ Unsupported in db* CODECOP Validators

Without access to the Oracle Data Dictionary, we cannot determine the number of rows to be processed.

REASON

A for loop can hide a too_many_rows exception. The more complex a query is, the higher is the risk that more than one row will be processed. This affects performance and can lead to a wrong result.

A for loop can also hide a no_data_found exception and the reader cannot determine whether this is intentional or not.

EXAMPLE (BAD)

```
create or replace package body employee_api is
 2
      function emp_name(in_empno in integer) return varchar2 is -- NOSONAR: non-deterministic
 3
         1_ename emp.ename%type;
 4
       begin
 5
          <<fetch_name>>
       for r in (
 6
 7
           select ename
8
              from emp
9
          where empno = in_empno
10
11
         loop
12
            1_ename := r.ename;
13
        end loop fetch_name;
14
          return l_ename;
15
       end emp_name;
16 end employee_api;
17 /
```

```
create or replace package body employee_api is
1
2
     function emp_name(in_empno in integer) return varchar2 is -- NOSONAR: non-deterministic
3
         1_ename emp.ename%type;
4
     begin
5
        select ename
6
      into l_ename
7
          from emp
8 where empno = in_empno;
9
        return l_ename;
10
     exception
11
      when no_data_found then
12
           return null;
13
        when too_many_rows then
14
           raise;
15
     end emp_name;
16 end employee_api;
17 /
```

Efficiency

REASON

If the loop index is used for anything but traffic control inside the loop, this is one of the indicators that a numeric for loop is being used incorrectly. The actual body of executable statements completely ignores the loop index. When that is the case, there is a good chance that you do not need the loop at all.

EXAMPLE (BAD)

```
1
    declare
      l_row pls_integer;
l_value pls_integer;
2
     1_row
3
4
     co_lower_bound constant simple_integer
                                                    := 1;
5
     co_upper_bound constant simple_integer
                                                    := 5;
6
     co_row_incr constant simple_integer
                                                    := 1:
7
     co_value_incr constant simple_integer := 10;
8
     co_delimiter constant types_up.short_text_type := ' '
9
      co_first_value constant simple_integer := 100;
10 begin
11
     1_row := co_lower_bound;
12
     l_value := co_first_value;
      <<for_loop>>
13
for i in co_lower_bound..co_upper_bound
   loop
15
      sys.dbms_output.put_line(l_row
16
17
          || co_delimiter
           || l_value);
18
19
         1_row := 1_row + co_row_incr;
20
         l_value := l_value + co_value_incr;
21
       end loop for_loop;
22
   end:
23
```

```
1
   declare
2
    co_lower_bound constant simple_integer
                                              := 1;
     3
4
     co_delimiter constant types_up.short_text_type := ' '
5
6
      co_first_value constant simple_integer := 100;
7
   begin
8
      <<for_loop>>
9
     for i in co_lower_bound..co_upper_bound
10
11
      sys.dbms_output.put_line(i
12
           || co_delimiter
13
           || to_char(co_first_value + i * co_value_incr));
14
      end loop for_loop;
15
   end:
16
```

Minor

Changeability, Maintainability

REASON

Your loop statement uses a hard-coded value for either its upper or lower bounds. This creates a "weak link" in your program because it assumes that this value will never change. A better practice is to create a named constant (or function) and reference this named element instead of the hard-coded value.

EXAMPLE (BAD)

```
declare
2
     co_lower_bound constant simple_integer := 1;
3
      co_upper_bound constant simple_integer := 5;
   begin
4
5
       <<for_loop>>
6
      for i in co_lower_bound..co_upper_bound
7
8
        sys.dbms_output.put_line(i);
     end loop for_loop;
9
10 end;
11 /
```

Exception Handling

G-5010: Try to use a error/logging framework for your application.

Reliability, Reusability, Testability

Unsupported in db* CODECOP Validators

We cannot identify logging framework and where it should be applied. Requires further definition regarding naming of the error/logging framework and its minimal use in PL/SQL code.

Reason

Having a framework to raise/handle/log your errors allows you to easily avoid duplicate application error numbers and having different error messages for the same type of error.

This kind of framework should include

- Logging (different channels like table, mail, file, etc. if needed)
- Error Raising
- · Multilanguage support if needed
- Translate Oracle Database error messages to a user friendly error text
- Error repository

Example (bad)

```
declare
    co_start constant logger_logs.text%type := 'start';
    co_end constant logger_logs.text%type := 'end';

begin
    sys.dbms_output.put_line(co_start);
    -- some processing
    sys.dbms_output.put_line(co_end);

end;

//
```

```
1 declare
2
     -- see https://github.com/OraOpenSource/Logger
3
      co_start constant logger_logs.text%type := 'start';
      co_end constant logger_logs.text%type := 'end';
4
5
      co_scope constant logger_logs.scope%type := 'demo';
6
   begin
   logger.log(co_start,co_scope);
7
8
       -- some processing
9
       logger.log(co_end, co_scope);
10 end;
11
```

G-5020: Never handle unnamed exceptions using the error number.

Critical

Maintainability

Reason

When literals are used for error numbers the reader needs the error message manual to unterstand what is going on. Commenting the code or using constants is an option, but it is better to use named exceptions instead, because it ensures a certain level of consistency which makes maintenance easier.

Example (bad)

```
1 declare
     co_no_data_found constant integer := -1;
3 begin
     my_package.some_processing(); -- some code which raises an exception
5 exception
6
     when too_many_rows then
7
        my_package.some_further_processing();
     when others then
8
9     if sqlcode = co_no_data_found then
10
           null:
11
         end if;
12 end;
13 /
```

G-5030: Never assign predefined exception names to user defined exceptions.

Reliability, Testability

Reason

This is error-prone because your local declaration overrides the global declaration. While it is technically possible to use the same names, it causes confusion for others needing to read and maintain this code. Additionally, you will need to be very careful to use the prefix standard in front of any reference that needs to use the default exception behavior of the Oracle Database.

Example (bad)

Using the code below, we are not able to handle the no_data_found exception raised by the select statement as we have overwritten that exception handler. In addition, our exception handler doesn't have an exception number assigned, which should be raised when the select statement does not find any rows.

```
declare
2
      1_dummy
                     dual.dummy%type;
3 no_data_found exception; -- violates also naming convention G-9113
     co_rownum constant simple_integer
5
      co_no_data_found constant types_up.short_text_type := 'no_data_found';
6
   begin
     select dummy
7
8
       into l_dummy
9
        from dual
10
      where rownum = co_rownum;
11
12
      if l_dummy is null then
raise no_data_found; -- NOSONAR: consequential error, violates G-5070
14
     end if;
15
   exception
     when no_data_found then
16
17
        sys.dbms_output.put_line(co_no_data_found);
18
   end;
19 /
```

```
Error report -
ORA-01403: no data found
ORA-06512: at line 7
01403. 00000 - "no data found"
*Cause: No data was found from the objects.
*Action: There was no data from the objects which may be due to end of fetch.
```

```
1 declare
   l_dummy dual.dummy%type;
 2
3 e_empty_value exception;
4 co_rownum constant simple_integer := 0;
    co_empty_value constant types_up.short_text_type := 'empty_value';
co_no_data_found constant types_up.short_text_type := 'no_data_found';
5
 6
 7 begin
8 select dummy
      into l_dummy
from dual
9
10
10 from dual
11 where rownum = co_rownum;
12
   if l_dummy is null then
13
14 raise e_empty_value;
15 end if;
16 exception
17
    when e_empty_value then
18
       sys.dbms_output.put_line(co_empty_value);
19
       when no_data_found then
20
       sys.dbms_output.put_line(co_no_data_found);
21 end;
22 /
```

G-5040: Avoid use of WHEN OTHERS clause in an exception section without any other specific handlers.

Reason

There is not necessarily anything wrong with using when others, but it can cause you to "lose" error information unless your handler code is relatively sophisticated. Generally, you should use when others to grab any and every error only after you have thought about your executable section and decided that you are not able to trap any specific exceptions. If you know, on the other hand, that a certain exception might be raised, include a handler for that error. By declaring two different exception handlers, the code more clearly states what we expect to have happen and how we want to handle the errors. That makes it easier to maintain and enhance. We also avoid hard-coding error numbers in checks against sqlcode.

When using a logging framework like Logger, consider making an exception to this rule and allow a when others even without other specific handlers, but *only* if the when others exception handler calls a logging procedure that saves the error stack (that otherwise is lost) and the last statement of the handler is raise.

Example (bad)

```
begin
    my_package.some_processing();
exception
when others then
    my_package.some_further_processing();
end;
//
```

Example (good)

```
begin
    my_package.some_processing();
exception
when dup_val_on_index then
    my_package.some_further_processing();
end;
//
```

An exception to the rule where when others can be good to log the error and then re-raise it:

```
begin
    my_package.some_processing();
exception

when others then
logger.log_error('Unhandled Exception');
raise;
end;
// end;
```

G-5050: Avoid use of the RAISE_APPLICATION_ERROR built-in procedure with a hard-coded 20nnn error number or hard-coded message.

Major

Changeability, Maintainability

Reason

If you are not very organized in the way you allocate, define and use the error numbers between 20999 and 20000 (those reserved by the Oracle Database for its user community), it is very easy to end up with conflicting usages. You should assign these error numbers to named constants and consolidate all definitions within a single package. When you call raise_application_error, you should reference these named elements and error message text stored in a table. Use your own raise procedure in place of explicit calls to raise_application_error. If you are raising a "system" exception like no_data_found, you must use raise. However, when you want to raise an application-specific error, you use raise_application_error. If you use the latter, you then have to provide an error number and message. This leads to unnecessary and damaging hard-coded values. A more fail-safe approach is to provide a predefined raise procedure that automatically checks the error number and determines the correct way to raise the error.

Example (bad)

```
declare
    co_invalid_emp_text constant types_up.text := 'Invalid employee_id';
begin
    raise_application_error(-20501 /* violates also G-1010 */,co_invalid_emp_text);
end;
// co_invalid_emp_text
```

```
begin
err_up.raise(in_error => err.co_invalid_employee_id);
end;
//
```

G-5060: Avoid unhandled exceptions.

Major

Reliability

Reason

This may be your intention, but you should review the code to confirm this behavior.

If you are raising an error in a program, then you are clearly predicting a situation in which that error will occur. You should consider including a handler in your code for predictable errors, allowing for a graceful and informative failure. After all, it is much more difficult for an enclosing block to be aware of the various errors you might raise and more importantly, what should be done in response to the error.

The form that this failure takes does not necessarily need to be an exception. When writing functions, you may well decide that in the case of certain exceptions, you will want to return a value such as <code>null</code>, rather than allow an exception to propagate out of the function.

Example (bad)

```
1
   create or replace package body department_api is
2
      function name_by_id(in_id in departments.department_id%type) -- NOSONAR: non-deterministic
3
         return departments.department_name%type is
4
                          constant departments.department_id%type := in_id;
5
         1_department_name departments.department_name%type;
6
    select department_name
7
     into l_department_name
8
9
          from departments
10
         where department_id = co_id;
11
12
         return l_department_name;
       end name_by_id;
14 end department_api;
15 /
```

```
create or replace package body department_api is
2
       function name_by_id(in_id in departments.department_id%type) -- NOSONAR: non-deterministic
3
          return departments.department_name%type is
4
          co_id constant departments.department_id%type := in_id;
5
          1_department_name departments.department_name%type;
6
       begin
7
          select department_name
8
       into l_department_name
9
           from departments
10
          where department_id = co_id;
11
12
          return l_department_name;
13
       exception
14
        when no_data_found then
15
            return null;
16
          when too_many_rows then
17
            raise;
18
       end name_by_id;
19
    end department_api;
20
```

G-5070: Avoid using Oracle predefined exceptions.

Blocker

Reliability

Reason

You have raised an exception whose name was defined by Oracle. While it is possible that you have a good reason for "using" one of Oracle's predefined exceptions, you should make sure that you would not be better off declaring your own exception and raising that instead.

If you decide to change the exception you are using, you should apply the same consideration to your own exceptions. Specifically, do not "re-use" exceptions. You should define a separate exception for each error condition, rather than use the same exception for different circumstances.

Being as specific as possible with the errors raised will allow developers to check for, and handle, the different kinds of errors the code might produce.

Example (bad)

```
1 declare
2    e_my_exception exception;
3 begin
4    raise e_my_exception;
5 end;
6 /
```

G-5080: Always use FORMAT_ERROR_BACKTRACE when using FORMAT_ERROR_STACK or SQLERRM.

Reason

In exception handler sqlerrm and format_error_stack won't tell you the exact line where the error occurred.

format_error_backtrace displays the call stack at the point where an exception was raised, even if the subprogram is called from an exception handler in an outer scope.

If you use sqlerrm or format_error_stack to log/display error, you should also include format_error_backtrace to identify the exact location where the exception was raised.

Example (bad)

```
create or replace package body order_api as
     procedure discount_and_recalculate(
2
3
          in_customer_id in integer
         ,in_discount in number
4
      ) is
5
6
         co_customer_id constant customer.id%type
                                                                 := in_customer_id;
         co_discount constant customer.discount_percentage%type := in_discount;
7
8
         co_error_label constant type_up.text
                                                                 := 'Error: ';
9
     begin
10
       customer_api.apply_discount(
            in_customer_id => co_customer_id
11
           , in_discount => co_discount
12
13
14
         customer_api.calc(co_customer_id);
15
     exception
16
       when zero_divide then
17
           null; -- ignore
18
         when others then
19
       logging_package.log_error(co_error_label || sqlerrm);
20
            raise:
21
       end discount_and_recalculate;
22
   end order_api;
23
```

```
1
    create or replace package body order_api as
 2
     procedure discount_and_recalculate(
 3
          in_customer_id in integer
          ,in_discount in number
 4
 5
       ) is
        co_customer_id constant customer.id%type := in_customer_icustomer_id%type := in_customer_icustomer_icustomer.id%type := in_discount; co_error_label constant type_up.text := 'Error: ';
 6
                                                                            := in_customer_id;
 7
8
9
                                                                             := ' - Backtrace: ';
          co_backtrace_label constant type_up.text
10
        begin
11
        customer_api.apply_discount(
           in_customer_id => co_customer_id
12
13
             , in_discount => co_discount
14
           );
15
          customer_api.calc(co_customer_id);
16
        exception
17
        when zero_divide then
18
            null; -- ignore
19
           when others then
20
           logging_package.log_error(
21
                 co_error_label
22
              || sqlerrm
23
                || co_backtrace_label
24
                 || sys.dbms_utility.format_error_backtrace
25
26
              raise;
27
        end discount_and_recalculate;
28 end order_api;
29 /
```

Dynamic SQL

G-6010: Always use a character variable to execute dynamic SQL.

Major

Maintainability, Testability

Reason

Having the executed statement in a variable makes it easier to debug your code (e.g. by logging the statement that failed).

Example (bad)

```
declare
l_next_val employees.employee_id%type;
begin
execute immediate 'select employees_seq.nextval from dual'
into l_next_val;
end;
//
```

```
declare
l_next_val employees.employee_id%type;
co_sql constant types_up.big_string_type :=
'select employees_seq.nextval from dual';
begin
execute immediate co_sql into l_next_val;
end;
// end;
```

G-6020: Try to use output bind arguments in the RETURNING INTO clause of dynamic DML statements rather than the USING clause.

Reason

When a dynamic insert, update, or delete statement has a returning clause, output bind arguments can go in the returning into clause or in the using clause.

You should use the returning into clause for values returned from a DML operation. Reserve out and in out bind variables for dynamic PL/SQL blocks that return values in PL/SQL variables.

Example (bad)

```
1
    create or replace package body employee_api is
 2
     procedure upd_salary(
 3
         in_employee_id in employees.employee_id%type
 4
         ,in_increase_pct in types_up.percentage
 5
         ,out_new_salary out employees.salary%type
       )
 6
 7
8
          co_employee_id constant employees.employee_id%type := in_employee_id;
9
         co_increase_pct constant types_up.percentage
                                                      := in_increase_pct;
        co_sql_stmt constant types_up.big_string_type := '
10
11
               update employees set salary = salary + (salary / 100 * :1)
12
               where employee_id = :2
13
           returning salary into :3';
14
       begin
15
          execute immediate co_sql_stmt
16
            using co_increase_pct, co_employee_id, out out_new_salary;
17
       end upd_salary;
18
   end employee_api;
19 /
```

```
create or replace package body employee_api is
2
       procedure upd_salary(
         in_employee_id in employees.employee_id%type
3
         ,in_increase_pct in types_up.percentage
4
         , out_new_salary out employees.salary%type
5
       )
6
7
       is
          co_employee_id constant employees.employee_id%type := in_employee_id;
8
9
          co_increase_pct constant types_up.percentage := in_increase_pct;
          co_sql_stmt constant types_up.big_string_type := '
10
               update employees set salary = salary + (salary / 100 * :1)
11
               where employee_id = :2
12
            returning salary into :3';
13
14
       begin
15
          execute immediate co_sql_stmt
16
             using co_increase_pct, co_employee_id
17
             returning into out_new_salary;
18
       end upd_salary;
19
    end employee_api;
20
```

Stored Objects

General

G-7110: Try to use named notation when calling program units.

Major

Changeability, Maintainability

REASON

Named notation makes sure that changes to the signature of the called program unit do not affect your call.

This is not needed for standard functions like (to_char , to_date , nv1, round, etc.) but should be followed for any other stored object having more than one parameter.

EXAMPLE (BAD)

```
declare
    r_employee employees%rowtype;
    co_id constant employees.employee_id%type := 107;
begin
    employee_api.employee_by_id(r_employee,co_id);
end;
//
```

```
declare
    r_employee employees%rowtype;
    co_id constant employees.employee_id%type := 107;
begin
    employee_api.employee_by_id(
        out_row => r_employee
        ,in_employee_id => co_id
    );
end;
fend;
formall declare
    r_employee_id%type := 107;
begin
    employee_api.employee_by_id(
        out_row => r_employee
        remployee
        remployee_id => co_id
    );
fend;
formall declare
    r_employee = 107;
formall declare
    r_employee_id%type := 107;
formall declare declared
```

Minor

Maintainability

REASON

It's a good alternative for comments to indicate the end of program units, especially if they are lengthy or nested.

EXAMPLE (BAD)

```
create or replace package body employee_api is
 2
       function employee_by_id(in_employee_id in integer) -- NOSONAR: non-deterministic
 3
         return employees%rowtype is
          co_employee_id constant employees.employee_id%type := in_employee_id;
 4
 5
          r_employee
                       employees%rowtype;
     begin
 6
 7
        select *
8
           into r_employee
9
           from employees
10
          where employee_id = co_employee_id;
11
12
         return r_employee;
13
       exception
         when no_data_found then
14
15
            null;
16
          when too_many_rows then
17
             raise;
18
       end;
19
    end;
20
    /
```

```
create or replace package body employee_api is
2
       function employee_by_id(in_employee_id in integer) -- NOSONAR: non-deterministic
3
        return employees%rowtype is
          co_employee_id constant employees.employee_id%type := in_employee_id;
4
5
          r_employee
                       employees%rowtype;
6
     begin
7
        select *
8
           into r_employee
9
           from employees
10
          where employee_id = co_employee_id;
11
12
         return r_employee;
13
       exception
14
        when no_data_found then
15
            null;
16
          when too_many_rows then
17
             raise;
18
       end employee_by_id;
19
    end employee_api;
20
```

Maintainability

REASON

Using create alone makes your scripts give an error if the program unit already exists, which makes the script not repeatable. It is good practice to use create or replace to avoid such errors.

EXAMPLE (BAD)

```
1 create package body employee_api is
2
      function employee_by_id(in_employee_id in integer) -- NOSONAR: non-deterministic
3
          return employees%rowtype is
4
          co_employee_id constant employees.employee_id%type := in_employee_id;
5
         r_employee
                       employees%rowtype;
6
       begin
7
         select *
8
           into r_employee
9
           from employees
10
          where employee_id = co_employee_id;
11
12
         return r_employee;
13
     exception
14
        when no_data_found then
15
            null;
         when too_many_rows then
16
17
            raise;
18
       end employee_by_id;
19 end employee_api;
20 /
```

```
1 create or replace package body employee_api is
2
       function employee_by_id(in_employee_id in integer) -- NOSONAR: non-deterministic
3
          return employees%rowtype is
4
          co_employee_id constant employees.employee_id%type := in_employee_id;
5
          r_employee
                       employees%rowtype;
6
       begin
7
         select *
8
           into r_employee
9
           from employees
10
          where employee_id = co_employee_id;
11
12
         return r_employee;
13
       exception
         when no_data_found then
14
15
            null;
16
         when too_many_rows then
17
            raise;
18
       end employee_by_id;
19
    end employee_api;
20
```

G-7130: Always use parameters or pull in definitions rather than referencing external variables in a local program unit.

Major

Maintainability, Reliability, Testability

REASON

Local procedures and functions offer an excellent way to avoid code redundancy and make your code more readable (and thus more maintainable). Your local program refers, however, an external data structure, i.e., a variable that is declared outside of the local program. Thus, it is acting as a global variable inside the program.

This external dependency is hidden, and may cause problems in the future. You should instead add a parameter to the parameter list of this program and pass the value through the list. This technique makes your program more reusable and avoids scoping problems, i.e. the program unit is less tied to particular variables in the program. In addition, unit encapsulation makes maintenance a lot easier and cheaper.

EXAMPLE (BAD)

```
create or replace package body employee_api is
 2
        procedure calc_salary(in_employee_id in integer) is
 3
          co_employee_id constant employees.employee_id%type := in_employee_id;
 4
                         employees%rowtype;
          r_emp
 5
 6
          function commission return number is -- NOSONAR: non-deterministic
 7
             l_commission employees.salary%type := 0;
8
          begin
9
            if r_emp.commission_pct is not null then
10
               l_commission := r_emp.salary * r_emp.commission_pct;
11
            end if;
12
13
             return l_commission;
          end commission;
14
15
       begin
        select *
16
17
           into r_emp
18
            from employees
19
           where employee_id = co_employee_id;
20
21
          sys.dbms_output.put_line(r_emp.salary + commission());
22
       exception
23
        when no_data_found then
24
            null;
25
         when too_many_rows then
26
            null;
27
       end calc_salary;
28
    end employee_api;
29
```

```
1
    create or replace package body employee_api is
2
       procedure calc_salary(in_employee_id in integer) is
3
          co_employee_id constant employees.employee_id%type := in_employee_id;
4
          r_emp
                        employees%rowtype;
5
6
          function commission(
7
           in_salary in number
8
           ,in_comm_pct in number
9
          )
10
            return number
11
            deterministic
12
          is
            co_salary constant employees.salary%type := in_salary;
13
14
            co_comm_pct constant employees.commission_pct%type := in_comm_pct;
15
            l_commission employees.salary%type
                                                             := 0;
16
         begin
17
           if in_comm_pct is not null then
18
           l_commission := co_salary * co_comm_pct;
19
           end if;
20
21
            return l_commission;
22
         end commission;
23
       begin
24
       select *
25
          into r_emp
26
           from employees
27
         where employee_id = co_employee_id;
28
29
         sys.dbms_output.put_line(
30
           r_emp.salary + commission(in_salary => r_emp.salary
31
                                    ,in_comm_pct => r_emp.commission_pct)
32
         );
33
     exception
34
       when no_data_found then
35
           null;
36
         when too_many_rows then
37
           null;
38
       end calc_salary;
39 end employee_api;
40 /
```

Maintainability, Reliability

REASON

This can occur as the result of changes to code over time, but you should make sure that this situation does not reflect a problem. And you should remove the declaration to avoid maintenance errors in the future.

You should go through your programs and remove any part of your code that is no longer used. This is a relatively straightforward process for variables and named constants. Simply execute searches for a variable's name in that variable's scope. If you find that the only place it appears is in its declaration, delete the declaration.

There is never a better time to review all the steps you took, and to understand the reasons you took them, then immediately upon completion of your program. If you wait, you will find it particularly difficult to remember those parts of the program that were needed at one point, but were rendered unnecessary in the end.

EXAMPLE (BAD)

```
create or replace package body my_package is
2
       procedure my_procedure is
3
      function my_func return number
4
             deterministic
5
6
            co_true constant integer := 1;
7
8
          return co_true;
9
         end my_func;
10
       begin
11
       null;
       end my_procedure;
12
13
   end my_package;
14
```

```
create or replace package body my_package is
2
       procedure my_procedure is
3
       function my_func return number
4
             deterministic
5
6
             co_true constant integer := 1;
7
8
          return co_true;
9
          end my_func;
10
       begin
         sys.dbms_output.put_line(my_func());
11
12
       end my_procedure;
13
   end my_package;
14
```

Efficiency, Maintainability

REASON

You should go through your programs and remove any parameter that is no longer used.

EXAMPLE (BAD)

```
create or replace package body department_api is
2
        function name_by_id( -- NOSONAR: non-deterministic
3
           in_department_id in integer
         ,in_manager in employees%rowtype
4
5
           return departments.department_name%type is
6
7
           \verb|co_department_id| constant departments.department_id % type := in_department_id; \\
8
           1_department_name departments.department_name%type;
9
        begin
          <<find_department>>
10
          begin
11
             select department_name
12
13
                into l_department_name
14
                from departments
15
              where department_id = co_department_id;
16
           exception
17
             when no_data_found or too_many_rows then
18
                 1_department_name := null;
           end find_department;
19
20
21
           return l_department_name;
22
        end name_by_id;
23
    end department_api;
24
```

```
create or replace package body department_api is
2
        function name_by_id( -- NOSONAR: non-deterministic
3
           in_department_id in integer
4
5
           return departments.department_name%type is
6
           co_department_id constant departments.department_id%type := in_department_id;
7
          1_department_name departments.department_name%type;
8
        begin
9
          <<find_department>>
10
          begin
11
            select department_name
12
               into l_department_name
13
                from departments
14
              where department_id = co_department_id;
15
           exception
16
             when no_data_found or too_many_rows then
17
                 1_department_name := null;
18
           end find_department;
19
20
           return l_department_name;
21
        end name_by_id;
22
    end department_api;
23
```

Maintainability

REASON

By showing the mode of parameters, you help the reader. If you do not specify a parameter mode, the default mode is in . Explicitly showing the mode indication of all parameters is a more assertive action than simply taking the default mode. Anyone reviewing the code later will be more confident that you intended the parameter mode to be in, out or in out .

EXAMPLE (BAD)

```
create or replace package employee_api is
procedure store(io_id in out employees.id%type

in_first_name in employees.first_name%type
in_last_name in employees.last_name%type
in_email in employees.email%type
in_department_id in employees.department_id%type
in_department_id in employees.department_id%type
in_department_id in employees.department_id%type
in_employees_up;
end employee_up;
```

Efficiency, Maintainability

★ Unsupported in db* CODECOP Validators

We cannot determine the usage of an in out parameter in a reliable way, especially when other units are involved which are maintained in another file.

REASON

Avoid using parameter mode in out unless you actually use the parameter both as input and output. If the code body only reads from the parameter, use in; if the code body only assigns to the parameter, use out. If at the beginning of a project you expect a parameter to be both input and output and therefore choose in out just in case, but later development shows the parameter actually is only in or out, you should change the parameter mode accordingly.

EXAMPLE (BAD)

```
create or replace package body employee_up is
1
2
     procedure rcv_emp(
       io_first_name in out employees.first_name%type
,io_last_name in out employees.last_name%type
,io_email in out employees.email%type
3
4
5
                         in out employees.email%type
6
       ,io_phone_number in out employees.phone_number%type
7
       8
9
10
       ,io_commission_pct in out employees.commission_pct%type
       ,io_manager_id in out employees.manager_id%type

            sys.dbms_pipe.unpack_message(out_first_name);
27
             sys.dbms_pipe.unpack_message(out_last_name);
28
            sys.dbms_pipe.unpack_message(out_email);
29
             sys.dbms_pipe.unpack_message(out_phone_number);
30
             sys.dbms_pipe.unpack_message(out_hire_date);
31
             sys.dbms_pipe.unpack_message(out_job_id);
32
           sys.dbms_pipe.unpack_message(out_salary);
33
             sys.dbms_pipe.unpack_message(out_commission_pct);
34
             sys.dbms_pipe.unpack_message(out_manager_id);
35
             sys.dbms_pipe.unpack_message(out_department_id);
36
          end if;
37
       end rcv_emp;
38 end employee_up;
39 /
```

Packages

G-7210: Try to keep your packages small. Include only few procedures and functions that are used in the same context.

Major

Efficiency, Maintainability

REASON

The entire package is loaded into memory when the package is called the first time. To optimize memory consumption and keep load time small packages should be kept small but include components that are used together.

Minor

Changeability

REASON

Having forward declarations allows you to order the functions and procedures of the package in a reasonable way.

EXAMPLE (BAD)

```
create or replace package department_api is
 2
       procedure del(in_department_id in departments.department_id%type);
 3
    end department_api;
 4
 5
 6
    create or replace package body department_api is
 7
        function does_exist(in_department_id in departments.department_id%type) -- violates also G-
7460
          return boolean is
8
9
          co_department_id constant departments.department_id%type := in_department_id;
         l_return
10
                         pls_integer;
11
       begin
12
         <<check_row_exists>>
         begin
13
14
            select 1
15
               into l_return
16
               from departments
17
              where department_id = co_department_id;
18
         exception
19
            when no_data_found or too_many_rows then
20
               l_return := 0;
21
          end check_row_exists;
22
23
         return l_return = 1;
24
       end does_exist;
25
       procedure del(in_department_id in departments.department_id%type) is
26
          co_department_id constant departments.department_id%type := in_department_id;
27
28
       begin
29
         if does_exist(co_department_id) then
30
             null;
31
          end if;
32
       end del;
33
    end department_api;
34
```

```
1
    create or replace package department_api is
 2
    procedure del(in_department_id in departments.department_id%type);
 3
    end department_api;
 4
 5
 6
    create or replace package body department_api is
 7
       function does_exist(in_department_id in departments.department_id%type) -- NOSONAR: non-
deterministic
8
          return boolean;
9
10
       procedure del(in_department_id in departments.department_id%type) is
11
         co_department_id constant departments.department_id%type := in_department_id;
12
13
       if does_exist(co_department_id) then
14
            null;
15
         end if;
16
       end del;
17
18
       function does_exist(in_department_id in departments.department_id%type) -- NOSONAR: non-
deterministic
19
         return boolean is
20
          co_department_id constant departments.department_id%type := in_department_id;
21
          l_return
                         pls_integer;
22
     begin
23
         <<check_row_exists>>
24
         begin
25
            select 1
26
              into l_return
27
              from departments
28
             where department_id = co_department_id;
29
30
           when no_data_found or too_many_rows then
31
               1_return := 0;
32
         end check_row_exists;
33
34
          return l_return = 1;
35
       end does_exist;
36 end department_api;
37 /
```

Reliability

REASON

You should always declare package-level data (non-constants) inside the package body. You can then define "get and set" methods (functions and procedures, respectively) in the package specification to provide controlled access to that data. By doing so you can guarantee data integrity, you can change your data structure implementation, and also track access to those data structures.

Data structures (scalar variables, collections, cursors) declared in the package specification (not within any specific program) can be referenced directly by any program running in a session with execute rights to the package.

Instead, declare all package-level data in the package body and provide "get and set" methods - a function to get the value and a procedure to set the value - in the package specification. Developers then can access the data using these methods - and will automatically follow all rules you set upon data modification.

For package-level constants, consider whether the constant should be public and usable from other code, or if only relevant for code within the package. If the latter, declare the constant in the package body. If the former, it is typically good practice to place the constants in a package specification that only holds constants.

EXAMPLE (BAD)

```
1
   create or replace package employee_api as
2
     co_min_increase constant types_up.sal_increase_type := 0.01;
3
       co_max_increase constant types_up.sal_increase_type := 0.5;
4 g_salary_increase types_up.sal_increase_type := co_min_increase;
5
6
       procedure set_salary_increase(in_increase in types_up.sal_increase_type);
7
       function salary_increase return types_up.sal_increase_type; -- NOSONAR: non-deterministic
8
    end employee_api;
9
10
11
    create or replace package body employee_api as
12
       procedure set_salary_increase(in_increase in types_up.sal_increase_type) is
13
          co_increase constant types_up.sal_increase_type := in_increase;
14
15
          g_salary_increase := greatest(least(co_increase, co_max_increase)
16
                                       , co_min_increase);
17
       end set_salary_increase;
18
19
       function salary_increase return types_up.sal_increase_type is -- NOSONAR: non-deterministic
20
21
          return g_salary_increase;
22
       end salary_increase;
23
    end employee_api;
24
```

```
1
    create or replace package constants_up as
    co_min_increase constant types_up.sal_increase_type := 0.01;
 2
 3
       co_max_increase constant types_up.sal_increase_type := 0.5;
 4
    end constants_up;
 5
 6
 7
    create or replace package employee_api as
8
       procedure set_salary_increase(in_increase in types_up.sal_increase_type);
9
        function salary_increase return types_up.sal_increase_type; -- NOSONAR: non-deterministic
10
    end employee_api;
11
12
13
    create or replace package body employee_api as
14
       g_salary_increase types_up.sal_increase_type;
15
16
       procedure init;
17
       procedure set_salary_increase(in_increase in types_up.sal_increase_type) is
18
19
          co_increase constant types_up.sal_increase_type := in_increase;
20
       begin
21
         g_salary_increase := greatest(least(co_increase, constants_up.co_max_increase)
22
                                       , constants_up.co_min_increase);
23
       end set_salary_increase;
24
25
       function salary_increase return types_up.sal_increase_type is -- NOSONAR: non-deterministic
26
       begin
27
          return g_salary_increase;
28
       end salary_increase;
29
30
       procedure init
31
       is
32
       begin
33
          g_salary_increase := constants_up.co_min_increase;
34
       end init;
35
    begin
36
       init();
37
    end employee_api;
38
```

Maintainability

REASON

The purpose of the initialization block of a package body is to set initial values of the global variables of the package (initialize the package state). Although return is syntactically allowed in this block, it makes no sense. If it is the last keyword of the block, it is superfluous. If it is not the last keyword, then all code after the return is unreachable and thus dead code.

EXAMPLE (BAD)

```
create or replace package body employee_api as
2
        g_salary_increase types_up.sal_increase_type;
3
        procedure set_salary_increase(in_increase in types_up.sal_increase_type) is
4
5
           co_increase constant types_up.sal_increase_type := in_increase;
6
        begin
7
           g_salary_increase := greatest(least(co_increase,constants_up.max_salary_increase())
8
                                        , constants_up.min_salary_increase());
9
        end set_salary_increase;
10
        function salary_increase return types_up.sal_increase_type is -- NOSONAR: non-deterministic
11
12
        begin
13
          return g_salary_increase;
14
        end salary_increase;
15
16
    begin
        g_salary_increase := constants_up.min_salary_increase();
17
18
19
       return; -- violates also G-1040
20
21
        set_salary_increase(constants_up.min_salary_increase()); -- dead code
22
    end employee_api;
23
    /
```

```
create or replace package body employee_api as
2
        g_salary_increase types_up.sal_increase_type;
3
4
        procedure set_salary_increase(in_increase in types_up.sal_increase_type) is
5
          co_increase constant types_up.sal_increase_type := in_increase;
6
        begin
7
           g_salary_increase := greatest(least(co_increase,constants_up.max_salary_increase())
8
                                        , constants_up.min_salary_increase());
9
        end set_salary_increase;
10
11
        function salary_increase return types_up.sal_increase_type is -- NOSONAR: non-deterministic
12
        begin
13
          return g_salary_increase;
14
        end salary_increase;
15
16
    begin
17
        g_salary_increase := constants_up.min_salary_increase();
18
    end employee_api;
19
```

Procedures

G-7310: Avoid standalone procedures – put your procedures in packages.

Minor

Maintainability

REASON

Use packages to structure your code, combine procedures and functions which belong together.

Package bodies may be changed and compiled without invalidating other packages. This is a major advantage compared to standalone procedures and functions.

EXAMPLE (BAD)

```
create or replace procedure my_procedure is
begin
null;
end my_procedure;
//
```

```
1 create or replace package my_package is
2
      procedure my_procedure;
3
   end my_package;
4
5
6
   create or replace package body my_package is
7
    procedure my_procedure is
8
       begin
9
         null;
     end my_procedure;
10
11 end my_package;
12
```

Major

Maintainability, Testability

REASON

Use of the return statement is legal within a procedure in PL/SQL, but it is very similar to a goto, which means you end up with poorly structured code that is hard to debug and maintain.

A good general rule to follow as you write your PL/SQL programs is "one way in and one way out". In other words, there should be just one way to enter or call a program, and there should be one way out, one exit path from a program (or loop) on successful termination. By following this rule, you end up with code that is much easier to trace, debug, and maintain.

EXAMPLE (BAD)

```
create or replace package body my_package is
2
      procedure my_procedure is
3
          l_idx simple_integer
4
          co_modulo constant simple_integer := 7;
5
      begin
6
          <<mod7_loop>>
7
          loop
            if mod(l_idx, co_modulo) = 0 then
8
9
               return;
10
            end if;
11
12
            l_{idx} := l_{idx} + 1;
13
         end loop mod7_loop;
14
       end my_procedure;
15
   end my_package;
16
```

```
create or replace package body my_package is
2
       procedure my_procedure is
3
          l_idx simple_integer
          co_modulo constant simple_integer := 7;
4
5
       begin
6
          <<mod7_loop>>
7
          loop
8
            exit mod7\_loop when <math>mod(l\_idx, co\_modulo) = 0;
9
10
             l_idx := l_idx + 1;
11
          end loop mod7_loop;
12
       end my_procedure;
13
    end my_package;
14
```

🇯 Blocker

Maintainability, Testability

REASON

Marking a parameter for output means that callers will expect its value to be updated with a result from the execution of the procedure. Failing to update the parameter before the procedure returns is surely an error.

EXAMPLE (BAD)

```
1 create or replace package body my_package is
procedure greet(
3
        in_name in varchar2
4
       ,out_greeting out varchar2 -- violates also G-7150
5 ) is
6
        l_message types_up.text;
7
       co_name constant employees.first_name := in_name;
8
        co_hello constant types_up.text := 'Hello, ';
9
10
        l_message := co_hello || co_name; -- NOSONAR: G-2135
11
     end greet;
12 end my_package;
13 /
```

```
1 create or replace package body my_package is
    procedure greet(
2
3
       in_name in varchar2
4
       ,out_greeting out varchar2
5 ) is
      co_name constant employees.first_name := in_name;
6
7
        co_hello constant types_up.text := 'Hello, ';
8
9     out_greeting := co_hello || co_name;
10
    end greet;
11 end my_package;
12
```

Functions

G-7410: Avoid standalone functions – put your functions in packages.

Minor

Maintainability

REASON

Use packages to structure your code, combine procedures and functions which belong together.

Package bodies may be changed and compiled without invalidating other packages. This is a major advantage compared to standalone procedures and functions.

EXAMPLE (BAD)

```
create or replace function my_function return varchar2
deterministic
is
begin
return null;
end my_function;
//
```

```
create or replace package body my_package is
function my_function return varchar2
deterministic
is
begin
return null;
end my_function;
end my_package;
//
```

Major

Maintainability

REASON

The reader expects the return statement to be the last statement of a function.

EXAMPLE (BAD)

```
create or replace package body my_package is
2
       function my_function(
3
        in_from in pls_integer
         ,in_to in pls_integer
4
5
       ) return pls_integer
6
         deterministic
7
8
         l_ret pls_integer;
9
      begin
       l_ret := in_from;
10
         <<for_loop>>
11
        for i in in_from..in_to
12
        loop
13
           l_ret := l_ret + i;
14
           if i = in_to then
15
16
               return l_ret;
17
            end if;
         end loop for_loop;
18
19
       end my_function;
20
    end my_package;
21
    /
```

```
create or replace package body my_package is
2
     function my_function(
         in_from in pls_integer
3
         ,in_to in pls_integer
4
       ) return pls_integer
5
6
          deterministic
7
8
         l_ret pls_integer;
9
      begin
       1_ret := in_from;
10
11
         <<for_loop>>
        for i in in_from..in_to
12
13
         loop
            l_ret := l_ret + i;
14
          end loop for_loop;
15
         return l_ret;
16
17
       end my_function;
18
    end my_package;
19
```

G-7430: Try to use no more than one RETURN statement within a function.

```
A
```

Major

Maintainability, Testability

REASON

A function should have a single point of entry as well as a single exit-point.

EXAMPLE (BAD)

```
create or replace package body my_package is
2
      function my_function(in_value in pls_integer) return boolean
3
         deterministic
4
5
         co_yes constant pls_integer := 1;
     begin
6
7
      if in_value = co_yes then
8
            return true;
9
        else
       return false;
10
       end if;
11
12
     end my_function;
13
   end my_package;
14
```

EXAMPLE (BETTER)

```
create or replace package body my_package is
2
      function my_function(in_value in pls_integer) return boolean
3
         deterministic
4
5
         co_yes constant pls_integer := 1;
         1_ret boolean;
6
7
     begin
       if in_value = co_yes then
8
9
           1_ret := true;
10
        else
11
          l_ret := false;
12
        end if;
13
14
        return l_ret;
15
     end my_function;
16
   end my_package;
17
    /
```

```
create or replace package body my_package is
2
      function my_function(in_value in pls_integer) return boolean
3
          deterministic
4
5
          co_yes constant pls_integer := 1;
     begin
6
7
     return in_value = co_yes;
     end my_function;
8
9 end my_package;
10
```

G-7440: Never use OUT parameters to return values from a function.

Major

Reusability

REASON

A function should return all its data through the return clause. Having an out parameter prohibits usage of a function within SQL statements.

EXAMPLE (BAD)

```
create or replace package body my_package is
function my_function(out_date out date) return boolean
deterministic
is
begin
out_date := sysdate;
return true;
end my_function;
end my_package;
//
```

```
create or replace package body my_package is
function my_function return date
deterministic
is
begin
return sysdate;
end my_function;
end my_package;
//
```

G-7450: Never return a NULL value from a BOOLEAN function.

🏥 Blocker

Reliability, Testability

REASON

If a boolean function returns null, the caller has do deal with it. This makes the usage cumbersome and more error-

EXAMPLE (BAD)

```
1 create or replace package body my_package is
2 function my_function return boolean
3
       deterministic
4 is begin
6 return null;
7 end my_function;
8 end my_package;
9 /
```

```
1 create or replace package body my_package is
2 function my_function return boolean
3
      deterministic
4 is begin
6 return true;
7 end my_function;
8 end my_package;
9 /
```

G-7460: Try to define your packaged/standalone function deterministic if appropriate.

Major

Efficiency

REASON

A deterministic function (always return same result for identical parameters) which is defined to be deterministic will be executed once per different parameter within a SQL statement whereas if the function is not defined to be deterministic it is executed once per result row.

EXAMPLE (BAD)

```
create or replace package department_api is
function name_by_id(in_department_id in departments.department_id%type)
return departments.department_name%type
deterministic;
end department_api;
///
```

Oracle Supplied Packages

G-7510: Always prefix Oracle supplied packages with owner schema name.

Major

Security

REASON

The signature of Oracle supplied packages is well known and therefore it is quite easy to provide packages with the same name as those from Oracle doing something completely different without you noticing it.

EXAMPLE (BAD)

```
declare
    co_hello_world constant string(30 char) := 'Hello World';
begin
dbms_output.put_line(co_hello_world);
end;
//
```

Object Types

There are no object type-specific recommendations to be defined at the time of writing.

Triggers

G-7710: Avoid cascading triggers.

Major

Maintainability, Testability

REASON

Having triggers that act on other tables in a way that causes triggers on that table to fire lead to obscure behavior.

EXAMPLE (BAD)

```
1 create or replace trigger dept_br_u
   before update on departments for each row
2
   begin
3
   insert into departments_hist (
4
5
         department_id
      , department_name
, manager_id
, location_id
6
7
8
9
         , modification_date)
     values (
10
        :old.department_id
11
        ,:old.department_name
12
        ,:old.manager_id
13
14
        ,:old.location_id
         , sysdate);
15
16
   end;
17
18
    create or replace trigger dept_hist_br_i
19
    before insert on departments_hist for each row
20
    begin
21    insert into departments_log (
22
          department_id
       , department_name
23
24
         , modification_date)
25
       values (
26
         :new.department_id
27
         ,:new.department_name
         , sysdate);
28
29
   end;
30
```

```
1 create or replace trigger dept_br_u
 2
     before update on departments for each row
 3
 4 insert into departments_hist (
    department_id
, department_name
, manager_id
, location_id
, modification_date)
 5
 6
 7
 8
 9
10
       values (
       :old.department_id
,:old.department_name
,:old.manager_id
,:old.location_id
11
12
13
14
15
          , sysdate);
16
17
       insert into departments_log (
18
         department_id
         , department_name
, modification_date)
19
20
21
         values (
22
         :old.department_id
23
           ,:old.department_name
24
           , sysdate);
25
26
    end;
27 /
```

🇯 Blocker

Maintainability, Reliability, Testability

REASON

A DML trigger can have multiple triggering events separated by or like before insert or delete or update of some_column . If you have multiple update of separated by or, only one of them (the last one) is actually used and you get no error message, so you have a bug waiting to happen. Instead you always should use a single update of with all columns comma-separated, or an update without of if you wish all columns.

EXAMPLE (BAD)

```
1 create or replace trigger dept_br_u
 2 before update of department_id or update of department_name -- violates also G-7730
 3
   on departments for each row
   begin
 4
     -- will only fire on updates of department_name
 5
      insert into departments_log (
      department_id
,department_name
 6
 7
8
9
         , modification_date)
      values (
10
       :old.department_id
11
        ,:old.department_name
12
13
         , sysdate);
14 end;
15
   /
```

```
1 create or replace trigger dept_br_u
 2 before update of department_id, department_name
 3 on departments for each row
4 begin
 5
     insert into departments_log (
      department_id
,department_name
 6
 7
8
         , modification_date)
      values (
9
       :old.department_id
10
11
         ,:old.department_name
12
         , sysdate);
13 end;
14 /
```

Minor

Maintainability, Testability

REASON

Rather than a single trigger handling multiple DML events with separated blocks of if inserting, if updating and if deleting, modularity by individual triggers per DML event helps maintaining and testing the code. If most of the code is common for either DML event (only small pieces of code are individual) consider an exception to the rule and allow if inserting, if updating and if deleting blocks, or alternatively gather the common code in a procedure and let individual triggers handle the individual pieces of code plus call the procedure with the common code.

If the trigger makes assignment to a primary key and there are child tables with a foreign key referring to this primary key, the database can make undesirable table locks. If such is the case, you should always use individual triggers. See G-7740 for details.

EXAMPLE (BAD)

```
1 create or replace trigger dept_br_iu
2 before insert or update
3 on departments for each row
4 begin
5
   if inserting then
6
        :new.created_date := sysdate;
7
     end if;
8
      if updating then
9
       :new.changed_date := sysdate;
10
      end if;
11 end;
12 /
```

```
create or replace trigger dept_br_i
before insert
3
   on departments for each row
4
   begin
5
       :new.created_date := sysdate;
6
   end:
7
8
9
   create or replace trigger dept_br_u
10 before update
11
   on departments for each row
12
13
       :new.changed_date := sysdate;
14
   end;
15 /
```

G-7740: Never handle multiple DML events per trigger if primary key is assigned in trigger.

Critical

Efficiency, Reliability

×

Unsupported in db* CODECOP Validators

We cannot identify what the primary key column(s) are to check if assignment to a primary key is taking place in the trigger.

REASON

If a trigger makes assignment to the primary key anywhere in the trigger code, that causes the session firing the trigger to take a lock on any child tables with a foreign key to this primary key. Even if the assignment is in for example an if inserting block and the trigger is fired by an update statement, such locks still happen unnecessarily. The issue is avoided by having one trigger for the insert containing the primary key assignment, and another trigger for the update. Or even better by handling the insert assignment as 'default on null' clauses, so that only an on update trigger is needed.

This locking of child tables behaviour goes for simple DML triggers as well as compound DML triggers where assignments to primary keys take place. It is not relevant for instead-of triggers on views, as it is not possible to assign :new values and therefore no locks on child tables are needed.

EXAMPLE (BAD)

```
1 create or replace trigger dept_br_iu
before insert or update -- NOSONAR: G-7730
3 on departments for each row
4 begin
5
      if inserting then
6 :new.department_id := department_seq.nextval; -- NOSONAR: G-3150
7
      :new.created_date := sysdate;
8
     end if;
9
      if updating then
10
        :new.changed_date := sysdate;
11
      end if;
12 end;
13 /
```

```
1 create or replace trigger dept_br_i
 2 before insert
 3 on departments for each row
 4 begin
 5 :new.department_id := department_seq.nextval; -- NOSONAR: G-3150
   :new.created_date := sysdate;
 6
7
   end;
8
   /
9
10
   create or replace trigger dept_br_u
11 before update
12 on departments for each row
13 begin
14
      :new.changed_date := sysdate;
15 end;
16 /
```

EXAMPLE (BEST)

```
1 alter table department modify department_id default on null department_seq.nextval;
   alter table department modify created_date default on null sysdate;
2
3
4
   create or replace trigger dept_br_u
5
   before update
6
   on departments for each row
7
   begin
8
      :new.changed_date := sysdate;
9 end;
10 /
```

Sequences

G-7810: Never use SQL inside PL/SQL to read sequence numbers (or SYSDATE).

REASON

Since Oracle Database 11g it is no longer needed to use a select statement to read a sequence (which would imply a context switch).

EXAMPLE (BAD)

```
declare
l_sequence_number employees.employee_id%type;
begin
l_sequence_number := employees_seq.nextval;
my_package.do_something(l_sequence_number);
end;
//
```

G-7910: Never use DML within a SQL macro.

Blocker

Reliability, Testability

RESTRICTION

Oracle Database 21c (19c from version 19.7 for table macros alone)

REASON

Doing DML (except for select) within a SQL macro can lead to disastrous side effects from calling the macro in a SQL query.

Logging macro calls via a call to a procedure that does DML in an autonomous transaction can be an exception to the rule.

EXAMPLE (BAD)

```
create or replace package body my_package is
2
      function row_generator(in_num_rows in number) -- NOSONAR: non-deterministic
3
          return varchar2 sql_macro as
4
       begin
5
          insert into function_calls(name, called_at, parameter_value)
6
          values ($$plsql_unit,current_timestamp,in_num_rows);
7
    commit;
8
9
          return 'select level as row_sequence -- NOSONAR: G-1050
10
                from dual
11
             connect by level <= in_num_rows';</pre>
12
      end row_generator;
13
    end my_package;
14
```

```
create or replace package body my_package is
2
      function row_generator(in_num_rows in number) -- NOSONAR: non-deterministic
3
          return varchar2 sql_macro as
4
       begin
5
       return 'select level as row_sequence -- NOSONAR: G-1050
6
                 from dual
7
             connect by level <= in_num_rows';</pre>
8
       end row_generator;
9
   end my_package;
10
```

Patterns

Checking the Number of Rows

G-8110: Never use SELECT COUNT(*) if you are only interested in the existence of a row.

REASON

If you do a select count(*) all rows will be read according to the where clause, even if only the availability of data is of interest. For this we have a big performance overhead. If we do a select count(*) ... where rownum = 1 there is also a overhead as there will be two communications between the PL/SQL and the SQL engine. See the following example for a better solution.

EXAMPLE (BAD)

```
1 declare
2
     l_count pls_integer;
     co_zero constant simple_integer
      co_salary constant employees.salary%type := 5000;
5 begin
6 select count(*)
7 into l_count
8
       from employees
9
      where salary < co_salary;</pre>
10
     if l_count > co_zero then
        <<emp_loop>>
11
12
        for r_emp in (
           select employee_id
13
             from employees
14
15
        loop
16
17
           if r_emp.salary < co_salary then</pre>
              my_package.my_proc(in_employee_id => r_emp.employee_id);
18
19
            end if;
         end loop emp_loop;
20
21
       end if;
22 end;
23
```

```
1
    declare
2
    co_salary constant employees.salary%type := 5000;
3 begin
4 <<emp_loop>>
5
     for r_emp in (
     select e1.employee_id
6
7
          from employees e1
8
      where exists(
9
                  select e2.salary
10
                    from employees e2
                   where e2.salary < co_salary</pre>
11
                )
12
13
14
       loop
         my_package.my_proc(in_employee_id => r_emp.employee_id);
15
       end loop emp_loop;
16
17 end;
18 /
```

Critical

Efficiency, Reliability

REASON

The result of an existence check is a snapshot of the current situation. You never know whether in the time between the check and the (insert) action someone else has decided to create a row with the values you checked. Therefore, you should only rely on constraints when it comes to prevention of duplicate records.

EXAMPLE (BAD)

```
create or replace package body department_api is
2
     procedure ins(in_r_department in departments%rowtype) is
3
         l_count pls_integer;
4
     begin
5
        select count(*) -- NOSONAR: a violation of G-8110 is a prerequisite for G-8120
6
           into l_count
7
           from departments
8
          where department_id = in_r_department.department_id;
9
10
    if l_{count} = 0 then
11 insert into departments
           values in_r_department;
12
13
         end if;
14
     end ins;
15 end department_api;
16 /
```

```
create or replace package body department_api is
     procedure ins(in_r_department in departments%rowtype) is
2
3
      begin
4 insert into departments
5
        values in_r_department;
6
      exception
    when dup_val_on_index then
7
8
           null; -- handle exception
9
      end ins;
10
   end department_api;
11
```

Access objects of foreign application schemas

G-8210: Always use synonyms when accessing objects of another application schema.

Minor

Changeability, Maintainability

REASON

If a connection is needed to a table that is placed in a foreign schema, using synonyms is a good choice. If there are structural changes to that table (e.g. the table name changes or the table changes into another schema) only the synonym has to be changed no changes to the package are needed (single point of change). If you only have read access for a table inside another schema, or there is another reason that does not allow you to change data in this table, you can switch the synonym to a table in your own schema. This is also good practice for testers working on test systems.

EXAMPLE (BAD)

```
1
   declare
2
   1_product_name oe.products.product_name%type;
3
      co_price constant oe.products@list_price%type := 1000;
4 begin
   select p.product_name
5
6
       into l_product_name
7 from oe.products p
8 where list_price > co_price;
9 exception
   when no_data_found then
10
       null; -- handle_no_data_found;
11
12
      when too_many_rows then
13
       null; -- handle_too_many_rows;
14 end;
15 /
```

```
create synonym oe_products for oe.products;
2
3
   declare
    1_product_name oe_products.product_name%type;
4
5
      co_price constant oe_products.list_price%type := 1000;
6
   begin
   select p.product_name
7
8
       into l_product_name
9
     from oe_products p
where list_price > co_price;
11 exception
12
   when no_data_found then
13
        null; -- handle_no_data_found;
14
     when too_many_rows then
15
       null; -- handle_too_many_rows;
16 end;
17 /
```

Validating input parameter size

G-8310: Always validate input parameter size by assigning the parameter to a size limited variable in the declaration section of program unit.

Major

Maintainability, Reliability, Reusability, Testability

REASON

This technique raises an error (value_error) which may not be handled in the called program unit. This is the right way to do it, as the error is not within this unit but when calling it, so the caller should handle the error.

To limit the number of false positives, only the following data types used in parameters should be considered:

- char
- dec
- decimal
- interval day to second
- interval year to month
- nchar
- number
- numeric
- nvarchar2
- varchar2
- %type

EXAMPLE (BAD)

```
1
    create or replace package body department_api is
 2
       function dept_by_name( -- NOSONAR: non-deterministic
 3
          in_dept_name in departments.department_name%type
 4
       )
 5
          return departments%rowtype is
 6
                                 departments%rowtype;
          r_return
 7
          co_max_dept_name_length constant integer := 20;
8
       begin
9
          if in_dept_name is null or length(in_dept_name) > co_max_dept_name_length then
10
           raise err.e_param_to_large;
11
        end if;
         -- get the department by name
12
13
         <<trap>>
14
         begin
15
            select *
16
              into r_return
17
              from departments
18
             where department_name = in_dept_name;
19
            return r_return;
20
        exception
21
          when no_data_found then
22
              return null;
23
            when too_many_rows then
24
               raise;
25
         end trap;
26
       end dept_by_name;
27 end department_api;
28 /
```

EXAMPLE (GOOD)

```
create or replace package body department_api is
1
       function dept_by_name( -- NOSONAR: non-deterministic
 2
 3
          in_dept_name in departments.department_name%type
 4
 5
          return departments%rowtype is
 6
          co_dept_name constant departments.department_name%type not null := in_dept_name;
 7
          r_return departments%rowtype;
8
       begin
9
          -- get the department by name
10
          <<trap>>
11
        begin
          select *
12
13
              into r_return
14
              from departments
15
             where department_name = co_dept_name;
16
            return r_return;
17
        exception
18
          when no_data_found then
19
              return null;
20
            when too_many_rows then
21
               raise;
22
         end trap;
23
       end dept_by_name;
24
   end department_api;
25
```

The exception should be handled where the function is called, like this:

```
declare
    co_dept_name constant type_up.text := 'Far to long name of a department';

begin
    pre_processing;
    r_department := department_api.dept_by_name(co_dept_name);
    post_processing;

exception
    when value_error then
    handle_error;

end;

//
```

Ensure single execution at a time of a program unit

G-8410: Always use application locks to ensure a program unit is only running once at a given time.

Blocker

Efficiency, Reliability

×

Unsupported in db* CODECOP Validators

We cannot identify where an application lock would make sense. Algorithms to detect wrong, missing and right usages of this pattern are virtually impossible to implement without understanding the context.

REASON

This technique allows us to have locks across transactions as well as a proven way to clean up at the end of the session.

The alternative using a table where a "Lock-Row" is stored has the disadvantage that in case of an error a proper cleanup has to be done to "unlock" the program unit.

EXAMPLE (BAD)

```
/* Example */
1
2
    create or replace package body lock_up is
3
       -- manage locks in a dedicated table created as follows:
 4
       -- CREATE TABLE app_locks (
 5
               lock_name VARCHAR2(128 CHAR) NOT NULL primary key
 6
       -- );
 7
8
       procedure request_lock(in_lock_name in varchar2) is
9
         co_lock_name constant app_locks.lock_name%type := in_lock_name;
10
       begin
       -- raises dup_val_on_index
11
         insert into app_locks (lock_name) values (co_lock_name);
12
13
       end request_lock;
14
15
       procedure release_lock(in_lock_name in varchar2) is
       co_lock_name constant app_locks.lock_name%type := in_lock_name;
16
17
       delete from app_locks where lock_name = co_lock_name;
18
19
       end release_lock;
20
    end lock_up;
21
22
23
    /* Call bad example */
24
   declare
25
       co_lock_name constant app_locks.lock_name%type := 'APPLICATION_LOCK';
26
27
       lock_up.request_lock(in_lock_name => co_lock_name);
28
       -- processing
29
       lock_up.release_lock(in_lock_name => co_lock_name);
30
   exception
31
       when dup_val_on_index then
32
         -- expected exception
33
         lock_up.release_lock(in_lock_name => co_lock_name);
34
         raise;
35
       when others then
36
          -- unexpected exception, logging is recommended
37
          lock_up.release_lock(in_lock_name => co_lock_name);
38
          raise;
39 end;
40 /
```

```
1
    /* Example */
 2
    create or replace package body lock_up is
 3
       function request_lock( -- NOSONAR: non-deterministic
 4
          5
         ,in_release_on_commit in boolean default false

Use dbms_application_info package to follow progress of a process

G-8510: Always use dbms_application_info to track program process transiently.

Critical

Efficiency, Reliability

×

Unsupported in db* CODECOP Validators

We cannot know where the use of dbms_application_info is sensible. Algorithms to detect wrong, missing and right usages of this pattern are virtually impossible to implement without understanding the context.

REASON

This technique allows us to view progress of a process without having to persistently write log data in either a table or a file. The information is accessible through the v\$session view.

EXAMPLE (BAD)

```
create or replace package body employee_api is
2
       procedure process_emps is
3
       begin
4
          <<employees>>
5
          for emp_rec in (
6
            select employee_id
7
               from employees
8
              order by employee_id
9
10
          loop
11
             -- some processing
12
             sys.dbms_output.put_line(emp_rec.employee_id);
13
          end loop employees;
14
       end process_emps;
15
    end employee_api;
16
```

```
1
    create or replace package body employee_api is
2
    procedure process_emps is
3
        co_action_name constant v$session.action%type := 'init';
4
         co_label constant v$session.action%type := 'Processing';
 5
     begin
          sys.dbms_application_info.set_module(
 6
7
            module_name => $$plsql_unit
8
           ,action_name => co_action_name
9
         );
10
          <<employees>>
11
         for emp_rec in (
12
          select employee_id
13
             from employees
14
             order by employee_id
          )
15
16
          loop
17
            -- some processing
            sys.dbms_application_info.set_action(co_label || emp_rec.employee_id);
18
19
          end loop employees;
20
       end process_emps;
21
    end employee_api;
22 /
```

Function Usage

G-9010: Always use a format model in string to date/time conversion functions.

Reason

Converting from strings to date or timestamp datatypes (using to_date, to_timestamp, to_timestamp_tz or cast to any of those datatypes) in practice always expects a fixed format (unlike converting to strings that can be fixed as well as allow the session to decide). Therefore it is a bad idea to allow this conversion to rely on the session NLS settings (nls_date_format, nls_timestamp_format and nls_timestamp_tz_format) as this makes the code vulnerable to changes in session and/or server configuration. It is even possible to utilize session nls_date_format for SQL injection if you use dynamic SQL.

Using an explicit format model for string to date or timestamp conversion avoids this inappropriate dependability on configurable NLS parameters.

Example (bad)

```
1 create or replace package body employee_api is
2
     procedure set_dob(
3
         in_employee_id in employees.employee_id%type
4
        ,in_dob_str in varchar2
5
        co_employee_id constant employees.employee_id%type := in_employee_id;
6
7
         co_dob_str constant type_up.date_string := in_dob_str;
8
     begin
9
      update employees
           set date_of_birth = to_date(co_dob_str default null on conversion error)
10
11
         where employee_id = co_employee_id;
12
      end set_dob;
13 end employee_api;
14 /
```

```
1 create or replace package body employee_api is
2
       procedure set_dob(
3
          in_employee_id in employees.employee_id%type
         ,in_dob_str in varchar2
4
5
       ) is
         co_employee_id constant employees.employee_id%type := in_employee_id;
6
7
         co_dob_str constant type_up.date_string := in_dob_str;
8
       begin
9
        update employees
10
           set date_of_birth = to_date(
                   co_dob_str default null on conversion error
11
12
                  , 'FXYYYY-MM-DD'
13
14
          where employee_id = co_employee_id;
15
       end set_dob;
16
   end employee_api;
17
```

G-9020: Try to use a format model and NLS_NUMERIC_CHARACTERS in string to number conversion functions.

🇯 Blocker

Changeability, Maintainability, Reliability, Security, Testability

Reason

Converting from strings to numeric datatypes (using to_number, to_binary_double, to_binary_float or cast to any of those datatypes) rely on session NLS settings for nls_numeric_characters. Typically the input string is expected to have a given decimal- and group-separator, so it is best practice to specify nls_numeric_characters in the function call. However, this requires also setting a format model, which is a good idea but can require a very large format model with many 9's if you do not know the maximum length of the string.

To avoid an inappropriate dependability on configurable NLS parameters, try to use both format model and <code>nls_numeric_characters</code> in the conversion function call. The exceptions can be if the input is known to always be integer with no decimal- or group-separator, or if you do not know the maximum number of digits **and** have control over the session <code>nls_numeric_characters</code> parameter.

Example (bad)

```
1 create or replace package body employee_api is
2
       procedure set_salary(
3
         in_employee_id in employees.employee_id%type
         ,in_salary in varchar2
4
5
       ) is
6
         co_employee_id constant eployees.employee_id%type := in_employee_id;
7
         co_salary constant type_up.date_string := in_salary;
8
      beain
9
      update employees
           set salary = to_number(co_salary default null on conversion error)
10
11
         where employee_id = co_employee_id;
12
       end set_dob;
13 end employee_api;
14
```

```
create or replace package body employee_api is
2
       procedure set_salary(
3
          in_employee_id in employees.employee_id%type
         ,in_salary in varchar2
4
5
       ) is
          co_employee_id constant eployees.employee_id%type := in_employee_id;
6
          co_salary
7
                       constant type_up.string
                                                          := in_salary;
8
       begin
9
        update employees
10
           set salary = to_number(
                   co_salary default null on conversion error
11
                   , '9999999999999999999999999999
12
                  ,q'[nls_numeric_characters='.,']'
13
14
15
          where employee_id = co_employee_id;
16
       end set_dob;
17
    end employee_api;
```

G-9030: Try to define a default value on conversion errors.

Major

Maintainability, Reliability, Testability

Restriction

Oracle Database 12c Release 2

Reason

When converting from strings to other datatypes using a conversion function that supports the default ... on conversion error clause, it is a good idea to use this clause to avoid getting an error raised on bad input. The exception can be when you explicitly want an error to be raised to catch and process it in a later exception handler.

Example (bad)

```
1 create or replace package body employee_api is
2
     procedure set_dob(
3
         in_employee_id in employees.employee_id%type
4
        ,in_dob_str
                     in varchar2
5
6
         co_employee_id constant employees.employee_id%type := in_employee_id;
7
         co_dob_str constant type_up.date_string := in_dob_str;
8
9
      update employees
10
     set date_of_birth = to_date(co_dob_str,'FXYYYY-MM-DD') -- violates also G-1050
11
         where employee_id = co_employee_id;
12
       end set_dob;
13 end employee_api;
14 /
```

```
create or replace package body employee_api is
2
       procedure set_dob(
3
          in_employee_id in employees.employee_id%type
         ,in_dob_str in varchar2
4
       ) is
5
6
         co_employee_id constant employees.employee_id%type := in_employee_id;
7
         co_dob_str constant type_up.date_string := in_dob_str;
8
       begin
9
        update employees
10
           set date_of_birth = to_date(
11
                 co_dob_str default null on conversion error
                  ,'FXYYYY-MM-DD' -- NOSONAR: G-1050 must be a literal
12
13
14
          where employee_id = co_employee_id;
15
       end set_dob;
16
   end employee_api;
17
```

G-9040: Try using FX in string to date/time conversion format model to avoid fuzzy conversion.

🇯 Blocker

Reliability, Testability

Reason

The default string-to-date conversion rules allow fuzzy conversion when converting from strings to date or timestamp datatypes (using to_date, to_timestamp, to_timestamp_tz or cast to any of those datatypes). For example you can omit punctuation characters, use any non-alphanumeric character for punctuation, use month name instead of number, or various other rules.

In practice you almost always expect a truly fixed format and want the database to enforce the format model and raise an error if the data does not match the format model. This you can achieve by adding the format modifier FX (format exact).

The exception to this rule can be if you are converting textual input typed by a user, in which case the fuzzy conversion may be what you want.

Example (bad)

```
1 create or replace package body employee_api is
2
     procedure set_dob(
3
        in_employee_id in employees.employee_id%type
4
        ,in_dob_str in varchar2
      ) is
5
6
        co_employee_id constant employees.employee_id%type := in_employee_id;
7
         co_dob_str constant type_up.date_string := in_dob_str;
8
     begin
9
      update employees
10
          set date_of_birth = to_date(
                  co_dob_str default null on conversion error
11
12
                 , 'YYYY-MM-DD'
13
         where employee_id = co_employee_id;
14
       end set_dob;
15
16 end employee_api;
17
```

```
1
   create or replace package body employee_api is
2
   procedure set_dob(
       in_employee_id in employees.employee_id%type
3
4
        ,in_dob_str in varchar2
5
      ) is
      co_employee_id constant employees.employee_id%type := in_employee_id;
 6
7
         co_dob_str constant type_up.date_string := in_dob_str;
8
     begin
      update employees
9
10
          set date_of_birth = to_date(
                  co_dob_str default null on conversion error
11
                 , 'FXYYYY-MM-DD'
12
13
             )
14
          where employee_id = co_employee_id;
15
       end set_dob;
16 end employee_api;
17 /
```

Complexity Analysis

Using software metrics like complexity analysis will guide you towards maintainable and testable pieces of code by reducing the complexity and splitting the code into smaller chunks.

Halstead Metrics

Calculation

First, we need to compute the following numbers, given the program:

- n_1 = the number of distinct operators
- n_2 = the number of distinct operands
- N_1 = the total number of operators
- N_2 = the total number of operands

From these numbers, five measures can be calculated:

- · Program length:
 - $N = N_1 + N_2$
- Program vocabulary:

$$n = n_1 + n_2$$

• Volume:

$$V = N \cdot log_2 n$$

· Difficulty:

$$D = \frac{n_1}{2} \cdot \frac{N_2}{n_2}$$

• Effort:

$$E = D \cdot V$$

The difficulty measure

D is related to the difficulty of the program to write or understand, e.g. when doing code review.

The volume measure

V describes the size of the implementation of an algorithm.

McCabe's Cyclomatic Complexity

Description

Cyclomatic complexity (or conditional complexity) is a software metric used to measure the complexity of a program. It directly measures the number of linearly independent paths through a program's source code.

Cyclomatic complexity is computed using the control flow graph of the program: the nodes of the graph correspond to indivisible groups of commands of a program, and a directed edge connects two nodes if the second command might be executed immediately after the first command. Cyclomatic complexity may also be applied to individual functions, modules, methods or classes within a program.

The cyclomatic complexity of a section of source code is the count of the number of linearly independent paths through the source code. For instance, if the source code contains no decision points, such as if statements or for loops, the complexity would be 1, since there is only a single path through the code. If the code has a single if statement containing a single condition there would be two paths through the code, one path where the if statement is evaluated as true and one path where the if statement is evaluated as false.

Calculation

Mathematically, the cyclomatic complexity of a structured program is defined with reference to a directed graph containing the basic blocks of the program, with an edge between two basic blocks if control may pass from the first to the second (the control flow graph of the program). The complexity is then defined as:

$$M = E - N + 2P$$

where

- *M* = cyclomatic complexity
- E = the number of edges of the graph
- N = the number of nodes of the graph
- P = the number of connected components.

Take, for example, a control flow graph of a simple program. The program begins executing at the red node, then enters a loop (group of three nodes immediately below the red node). On exiting the loop, there is a conditional statement (group below the loop), and finally the program exits at the blue node. For this graph,

$$E = 9$$
.

N=8 and

 $P\,{=}\,1$, so the cyclomatic complexity of the program is

3.

```
1
   declare
2
    co_upper_bound constant integer
                                                     := 3;
3
     4
                  constant user_objects.object_name%type := 'yes';
     co_yes
5
                  constant user_objects.object_name%type := 'end';
     co_end
6
  begin
7
      <<pre><<pre><<pre><<pre><<pre><</pre>
8
     for i in 1..co_upper_bound
9
10
        sys.dbms_output.put_line(co_msg || i);
11
     end loop print_in_loop;
12
13
      if 1 = 1 then
14
        sys.dbms_output.put_line(co_yes);
15
      end if;
16
17
      sys.dbms_output.put_line(co_end);
18
   end;
19
```

For a single program (or subroutine or method), P is always equal to 1. Cyclomatic complexity may, however, be applied

to several such programs or subprograms at the same time (e.g., to all of the methods in a class), and in these cases P will be equal to the number of programs in question, as each subprogram will appear as a disconnected subset of the graph.

It can be shown that the cyclomatic complexity of any structured program with only one entrance point and one exit point is equal to the number of decision points (i.e., if statements or conditional loops) contained in that program plus one.

Cyclomatic complexity may be extended to a program with multiple exit points; in this case it is equal to:

$$\pi = s + 2$$

Where

- \bullet $\;\pi$ is the number of decision points in the program, and
- *s* is the number of exit points.

Code Reviews

Code reviews check the results of software engineering. According to IEEE-Norm 729, a review is a more or less planned and structured analysis and evaluation process. Here we distinguish between code review and architect review.

To perform a code review means that after or during the development one or more reviewer proof-reads the code to find potential errors, potential areas for simplification, or test cases. A code review is a very good opportunity to save costs by fixing issues before the testing phase.

What can a code-review be good for?

- Code quality
- · Code clarity and maintainability
- · Quality of the overall architecture
- · Quality of the documentation
- Quality of the interface specification

For an effective review, the following factors must be considered:

- Definition of clear goals.
- Choice of a suitable person with constructive critical faculties.
- · Psychological aspects.
- · Selection of the right review techniques.
- Support of the review process from the management.
- Existence of a culture of learning and process optimization.

Requirements for the reviewer:

- He must not be the owner of the code.
- Code reviews may be unpleasant for the developer, as he could fear that his code will be criticized. If the critic is not considerate, the code writer will build up rejection and resistance against code reviews.

Tool Support

db* CODECOP for SQL Developer

Introduction

db* CODECOP for SQL Developer is a **free extension** to check an editor content for compliance violations of this coding guideline. The extension may be parameterized to your preferred set of rules and allows checking this set against a program unit.

db* CODECOP calculates metrics per PL/SQL unit, such as:

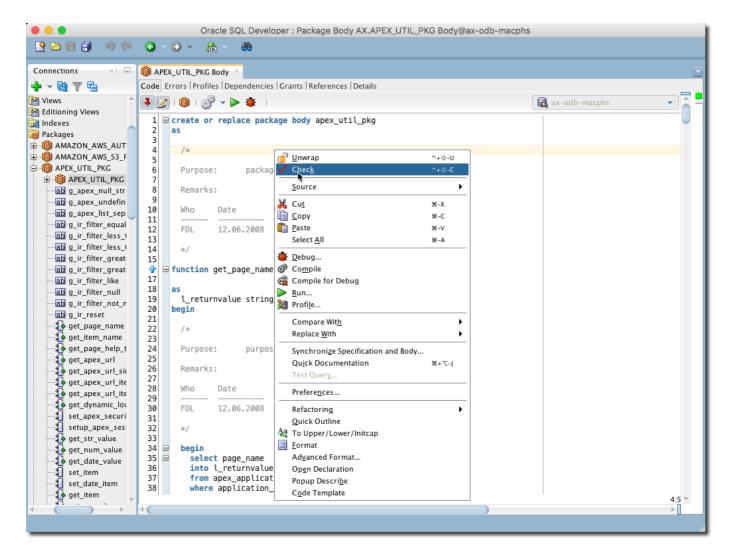

- McCabe's cyclomatic complexity
- Halstead's volume
- · The maintainability index
- Lines
- Commands (SQL*Plus and SQL)
- Statements (within a PL/SQL unit)
- · etc.

And aggregates them on file level.

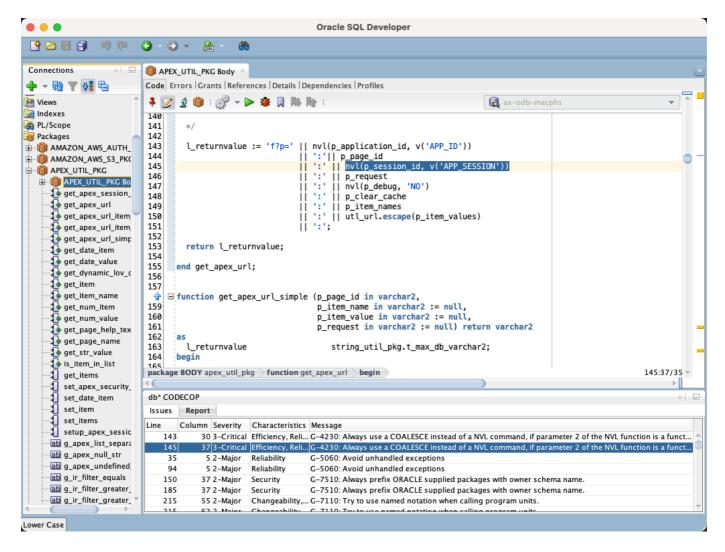

The results are presented in an additional tabbed panel. One tab shows all guideline violations to quickly navigate to the corresponding code position. The other tab contains a full HTML report, which also may be opened in your external browser.

Examples

Open a PL/SQL or SQL script in a SQL Developer editor and press Ctrl-Shift-C to check your code against the Trivadis PL/SQL & SQL guidelines.

Navigate through the issues using the cursor keys to highlight the related code section in the linked editor.

Dock the db* CODECOP output window on your favorite position within SQL Developer and click on the report tab to reveal some additional metrics. Open the report in an external browser to print or save the report.

db* CODECOP for SonarQube

Introduction

db* CODECOP for SonarQube is a plugin for SonarQube. The plugin analyses SQL and PL/SQL code and calculates various metrics and checks the code for compliance of this coding guideline.

A static code analysis is typically initiated as part of an continuous integration setup, e.g. at the end of a Jenkins or Hudson build job. SonarQube stores the result of the analysis in a relational database. Supported are PostgreSQL, Microsoft SQL Server and Oracle Database. For evaluation purposes, the embedded H2 database can also be used.

Since every analysis is stored as a snapshot in the SonarQube repository the improvement or the decrease of the code quality may be monitored very well. Use SonarQube and the db* CODECOP plugin if you care about your PL/SQL code quality.

Examples

Run Code Analysis via SonarScanner

You start an analysis from the command line as follows (seedocs for more information):

1 sonar-scanner -Dsonar.projectKey="sample"

Here's an excerpt of the output:

```
INFO: Scanner configuration file: /usr/local/opt/sonar-scanner/conf/sonar-scanner.properties

```

At the end of the run an URL to the scanner result is provided.

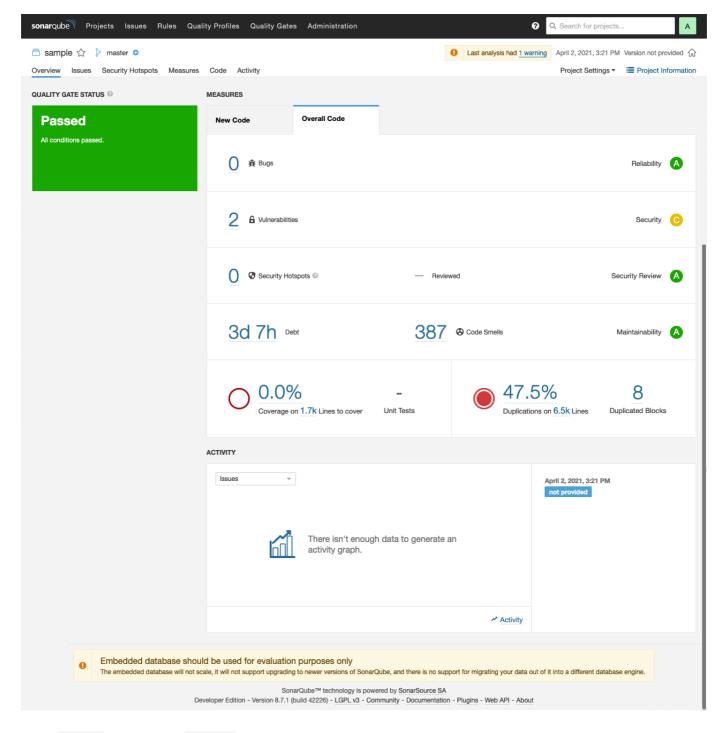

Run Code Analyis with CI Environments

You can call the SonarScanner also from Gradle, .NET projects, Maven, Ant, Jenkins, etc. Whichever method you use, in the end the analysis report will be uploaded to SonarQube.

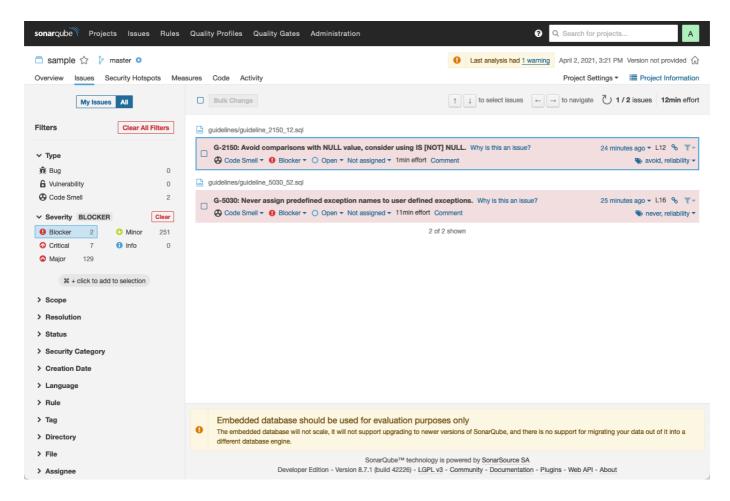

See SonarScanner for more information.

View Code Analysis Result in SonarQube

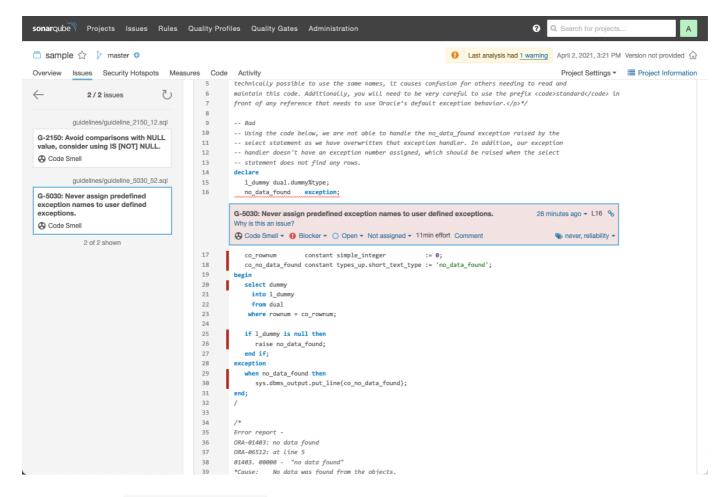

Here are the results of the previous analysis.

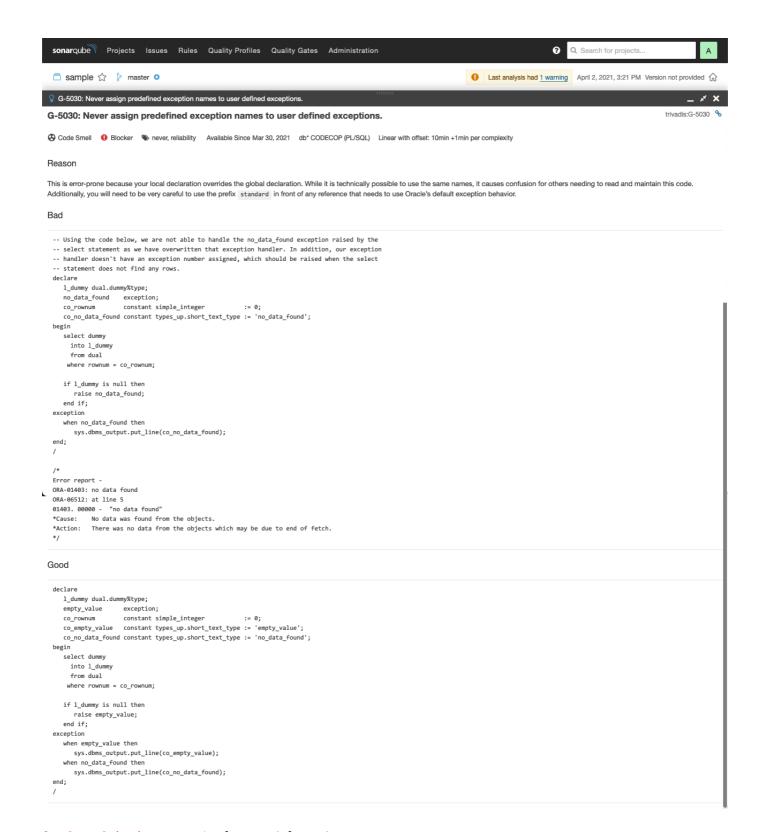

Under Issues the following Blocker are shown:

By clicking on the reddish box you can drill down to the source code.

When clicking on Why is this an issue? the complete rule is shown in similar way as in these guidelines.

See SonarQube documentation for more information.

db* CODECOP Command Line

Introduction

Trivadis db* CODECOP is a command line utility to check Oracle SQL*Plus files for compliance violations of this coding guideline.

Furthermore McCabe's cyclomatic complexity, Halstead's volume, the maintainability index and some other software metrics are calculated for each PL/SQL unit and aggregated on file level.

The code checking results are stored in XML, HTML and Excel files for further processing.

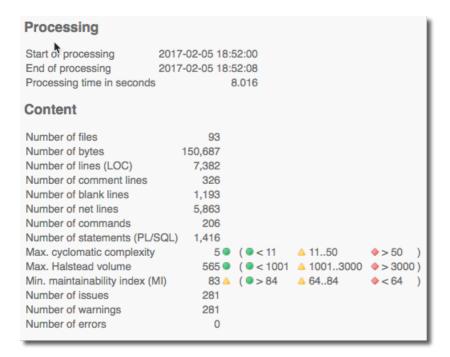

To get the most out of this command line utility you should make it part of your Continuous Integration environment by using the db* CODECOP for SonarQube plugin. This way you may control the quality of your code base over time.

Have also a look at db* CODECOP for SQL Developer if you are interested to check the code quality of PL/SQL code within SQL Developer. It's a free extension.

db* CODECOP supports custom validators. We provide some example validators in this GitHub repository. You may use these validators as is or amend/extend them to suit your needs.

Examples

Here are some screen shot taken from an of an HTML report based on the samples provided with db* CODECOP.

Issue Overview

N				3
#	%	Severity	Characteristics	Message
1	0.4%	Blocker	Portability, Reliability	G-2150: Avoid comparisons with NULL value, consider using IS [NOT] NULL.
1	0.4%	Blocker	Reliability, Testability	G-5030: Never assign predefined exception names to user defined exceptions.
2	0.7%	Critical	Reliability	G-5070: Avoid using Oracle predefined exceptions
1	0.4%	Critical	Reliability	G-2160: Avoid initializing variables using functions in the declaration section.
1	0.4%	Critical	Reliability	G-4120: Avoid using %NOTFOUND directly after the FETCH when working with BULK OP
1	0.4%	Critical	Efficiency, Reliability	G-4230: Always use COALESCE instead of NVL, if parameter 2 of the NVL function is a fun
1	0.4%	Critical	Efficiency, Reliability	G-4240: Always use CASE instead of NVL2 if parameter 2 or 3 of NVL2 is either a function
1	0.4%	Critical	Maintainability	G-5020: Never handle unnamed exceptions using the error number.
40	14.2%	Major	Efficiency	G-7460: Try to define your packaged/standalone function to be deterministic if appropriate.
8	2.8%	Major	Reliability	G-7230: Avoid declaring global variables public.
4	1.4%	Major	Maintainability	G-3120: Always use table aliases when your SQL statement involves more than one source
4	1.4%	Major	Maintainability	G-4370: Avoid using EXIT to stop loop processing unless you are in a basic loop.
3	1.1%	Major	Maintainability	G-2180: Never use quoted identifiers.
3	1.1%	Major	Changeability, Reliability	G-3180: Always specify column names instead of positional references in ORDER BY claus
3	1.1%	Major	Changeability, Maintainability	G-7110: Try to use named notation when calling program units.
3	1.1%	Major	Maintainability, Reliability, Testability	G-7130: Always use parameters or pull in definitions rather than referencing external variable
2	0.7%	Major	Portability	G-2510: Avoid using the LONG and LONG RAW data types.
2	0.7%	Major	Maintainability, Reliability	G-3140: Try to use anchored records as targets for your cursors.
2	0.7%	Major	Reliability	G-5040: Avoid use of WHEN OTHERS clause in an exception section without any other spe
2	0.7%	Major	Maintainability, Testability	G-7430: Try to use no more than one RETURN statement within a function.
2	0.7%	Major	Maintainability Testability	G-7710: Avoid cascading triggers.

1	7	Major	G-6010: Always use a character variable to execute dynamic SQL.	EXECUTE IMMEDIATE 'select employees_seq.nextval from								
2	7	Minor	G-1050: Avoid using literals in your code.	'select employees_seq.nextval from dual'								

These HTML and Excel reports have been created by db* CODECOP and are based on a simple set of good and bad example files distributed with db* CODECOP.

db* CODECOP Validators

db* CODECOP supports custom validators. A validator must implement the PLSQLCopValidator Java interface and has to be a direct or indirect descendant of the PLSQLValidator class. Such a class can be used in the command line utility and the SQL Developer extension.

For SonarQube a ValidationConfig is required. A config defines the validator with its rules and quality profile for SonarQube. See GLPValidatorConfig. The referenced XML files are generated based on the validator and the optional sample guidelines.

You may use these validators as is or amend/extend them to suit your needs.

Provided Validators

The db* CODECOP Validators project provides the following custom validators in the package com.trivadis.tvdcc.validators:

Class	Description
TrivadisPlsqlNaming	Checks Naming Conventions of the Trivadis PL/SQL & SQL Coding Guidelines
GLP	Checks naming of global and local variables and parameters
SQLInjection	Looks for SQL injection vulnerabilities, e.g. unasserted parameters in dynamic SQL
Hint	Looks for unknown hints and invalid table references
OverrideTrivadisGuidelines	Extends TrivadisGuidelines3 and overrides check for G-1050.
TrivadisGuidelines3Plus	Combines the validators TrivadisPlsqlNaming, SQLInjection and OverrideTrivadisGuidelines.

plscope-utils

Introduction

plscope-utils is based on PL/Scope which is available in the Oracle Database since version 11.1. It consists of the following two components:

• Core Database Objects

Provides relational views and PL/SQL packages to simplify common source code analysis tasks. Requires a server side installation.

• SQL Developer Extension (plscope-utils for SQL Developer)

Extends SQL Developer by a PL/Scope node in the database navigator tree, context menus, views shown for tables, views and PL/SQL nodes and some reports. Requires a client side installation only.

Part of plscope-utils is a check of naming conventions according to this coding guideline - either as a database view or a Oracle SQL Developer report.

PL/SQL & SQL Formatter Settings

Introduction

This GitHub repository provides formatter settings that follow the Coding Style of these guidelines.

Extensive settings using Arbori are provided for

- Oracle SQLcl
- Oracle SQL Developer

Simple configuration files are also available for

- · Allround Automations PL/SQL Developer
- · JetBrains DataGrip
- · Quest Toad for Oracle

There is also a standalone formatter that can be used in a Git pre-commit Hook to automate the formatting process. By the way, the code blocks in these guidelines were formatted using this standalone formatter.

Appendix

A - PL/SQL & SQL Coding Guidelines as PDF

These guidelines are primarily produced in HTML using Material for MkDocs.

However, we provide these guidelines also as PDF produced by wkhtmltopdf.

The formatting is not perfect, but it should be adequate for those who want to work with offline documents.

B - Mapping new guidelines to prior versions

Old Id	New Id	Text	Severity	Change- ability	Effi- ciency	Maintain- ability	Po abi
1	1010	Try to label your sub blocks.	Minor			X	
2	1020	Always have a matching loop or block label.	Minor			X	
3	1030	Avoid defining variables that are not used.	Major		Х	X	
4	1040	Avoid dead code.	Major			X	
5	1050	Avoid using literals in your code.	Minor	Х			
6	1060	Avoid storing ROWIDs or UROWIDs in database tables.	Blocker				
7	1070	Avoid nesting comment blocks.	Minor			X	

n/a	1080	Avoid using the same expression on both sides of a relational comparison operator or a logical operator.	Blocker		Х	Х	
8	2110	Try to use anchored declarations for variables, constants and types.	Major			х	
9	2120	Try to have a single location to define your types.	Minor	Х			
10	2130	Try to use subtypes for constructs used often in your code.	Minor	Х			
n/a	2135	Avoid assigning values to local variables that are not used by a subsequent statement.	Major		X	Х	
11	2140	Never initialize variables with NULL.	Minor			Х	
n/a	2145	Never self-assign a variable.	Blocker			Х	
12	2150	Avoid comparisons with NULL value, consider using IS [NOT] NULL.	Blocker				
13	2160	Avoid initializing variables using functions in the declaration section.	Critical				
14	2170	Never overload variables.	Major				
15	2180	Never use quoted identifiers.	Major			Х	
16	2185	Avoid using overly short names for explicitly or implicitly declared identifiers.	Major			Х	
17	2190	Avoid using ROWID or UROWID.	Blocker				
18	2210	Avoid declaring NUMBER variables, constants or subtypes with no precision.	Critical		X		

19	2220	Try to use PLS_INTEGER instead of NUMBER for arithmetic operations with integer values.	Critical		X		
n/a	2230	Try to use SIMPLE_INTEGER datatype when appropriate.	Critical		X		
20	2310	Avoid using CHAR data type.	Blocker				
21	2320	Never use VARCHAR data type.	Blocker				2
22	2330	Never use zero-length strings to substitute NULL.	Blocker				2
23	2340	Always define your VARCHAR2 variables using CHAR SEMANTIC (if not defined anchored).	Blocker				
24	2410	Try to use boolean data type for values with dual meaning.	Minor			Х	
25	2510	Avoid using the LONG and LONG RAW data types.	Major				
n/a	2610	Never use self-defined weak ref cursor types.	Minor	X		Х	
26	3110	Always specify the target columns when coding an insert statement.	Blocker			х	
n/a	3115	Avoid self-assigning a column.	Blocker			Х	
27	3120	Always use table aliases when your SQL statement involves more than one source.	Blocker			Х	
28	3130	Try to use ANSI SQL-92 join syntax.	Major			Х	
29	3140	Try to use anchored records as targets for your cursors.	Major			Х	
n/a	3145	Avoid using SELECT * directly from a table or view.	Blocker		Х	Х	

n/a	3150	Try to use identity columns for surrogate keys.	Critical			X	
n/a	3160	Avoid visible virtual columns.	Blocker			X	
n/a	3170	Always use DEFAULT ON NULL declarations to assign default values to table columns if you refuse to store NULL values.	Blocker				
n/a	3180	Always specify column names instead of positional references in ORDER BY clauses.	Major	X			
n/a	3182	Always specify column names/aliases instead of positional references in GROUP BY clauses.	Blocker				
n/a	3183	Always specify column aliases instead of expressions in GROUP BY clauses.	Minor			X	
n/a	3185	Never use ROWNUM at the same query level as ORDER BY.	Blocker				
n/a	3190	Avoid using NATURAL JOIN.	Blocker	X			
n/a	3195	Always use wildcards in a LIKE clause.	Blocker			X	
30	3210	Always use BULK OPERATIONS (BULK COLLECT, FORALL) whenever you have to execute a DML statement for more than 4 times.	Critical		X		
n/a	3220	Always process saved exceptions from a FORALL statement.	Critical				
n/a	3310	Never commit within a cursor loop.	Blocker		X		
n/a	3320	Try to move transactions within a non-cursor loop into procedures.	Major			X	

n/a	3330	Avoid autonomous transactions.	Blocker			
31	4110	Always use %NOTFOUND instead of NOT %FOUND to check whether a cursor returned data.	Minor		х	
32	4120	Avoid using %NOTFOUND directly after the FETCH when working with BULK OPERATIONS and LIMIT clause.	Blocker			
33	4130	Always close locally opened cursors.	Blocker	Х		
34	4140	Avoid executing any statements between a SQL operation and the usage of an implicit cursor attribute.	Blocker			
35	4210	Try to use CASE rather than an IF statement with multiple ELSIF paths.	Minor		х	
36	4220	Try to use CASE rather than DECODE.	Major		Х	
37	4230	Always use a COALESCE instead of a NVL command, if parameter 2 of the NVL function is a function call or a SELECT statement.	Critical	Х		
38	4240	Always use a CASE instead of a NVL2 command if parameter 2 or 3 of NVL2 is either a function call or a SELECT statement.	Critical	Х		
n/a	4250	Avoid using identical conditions in different branches of the same IF or CASE statement.	Blocker		х	
n/a	4260	Avoid inverting boolean conditions with NOT.	Minor		Х	
n/a	4270	Avoid comparing boolean values to boolean literals.	Minor		Х	

39	4310	Never use GOTO statements in your code.	Major			Х	
40	4320	Always label your loops.	Minor			Х	
n/a	4325	Never reuse labels in inner scopes.	Major			Х	
41	4330	Always use a CURSOR FOR loop to process the complete cursor results unless you are using bulk operations.	Major			Х	
42	4340	Always use a NUMERIC FOR loop to process a dense array.	Major			Х	
43	4350	Always use 1 as lower and COUNT() as upper bound when looping through a dense array.	Blocker				
44	4360	Always use a WHILE loop to process a loose array.	Critical		Х		
n/a	4365	Never use unconditional CONTINUE or EXIT in a loop.	Major			Х	
45	4370	Avoid using EXIT to stop loop processing unless you are in a basic loop.	Major			х	
46	4375	Always use EXIT WHEN instead of an IF statement to exit from a loop.	Minor			Х	
47	4380	Try to label your EXIT WHEN statements.	Minor			Х	
48	4385	Never use a cursor for loop to check whether a cursor returns data.	Critical		Х		
n/a	4387	!!!CHARACTERISTIC ERROR!!!	Blocker		Х		
49	4390	Avoid use of unreferenced FOR loop indexes.	Major		Х		
50	4395	Avoid hard-coded upper or lower bound values with FOR loops.	Minor	X		X	

n/a	5010	Try to use a error/logging framework for your application.	Critical			
51	5020	Never handle unnamed exceptions using the error number.	Critical		Х	
52	5030	Never assign predefined exception names to user defined exceptions.	Blocker			
53	5040	Avoid use of WHEN OTHERS clause in an exception section without any other specific handlers.	Critical			
54	n/a	Avoid use of EXCEPTION_INIT pragma for a 20nnn error.	Major			
55	5050	Avoid use of the RAISE_APPLICATION_ERROR built-in procedure with a hard-coded 20nnn error number or hard-coded message.	Major	Х	Х	
56	5060	Avoid unhandled exceptions.	Major			
57	5070	Avoid using Oracle predefined exceptions.	Blocker			
n/a	5080	Always use FORMAT_ERROR_BACKTRACE when using FORMAT_ERROR_STACK or SQLERRM.	Critical		X	
58	6010	Always use a character variable to execute dynamic SQL.	Major		х	
59	6020	Try to use output bind arguments in the RETURNING INTO clause of dynamic DML statements rather than the USING clause.	Minor		X	
60	7110	Try to use named notation when calling program units.	Major	Х	Х	

61	7120	Always add the name of the program unit to its end keyword.	Minor			х	
n/a	7125	Always use CREATE OR REPLACE instead of CREATE alone.	Major			х	
62	7130	Always use parameters or pull in definitions rather than referencing external variables in a local program unit.	Major			х	
63	7140	Always ensure that locally defined procedures or functions are referenced.	Major			х	
64	7150	Try to remove unused parameters.	Major		Х	Х	
68	7160	Always explicitly state parameter mode.	Major			Х	
n/a	7170	Avoid using an IN OUT parameter as IN or OUT only.	Major		X	X	
65	7210	Try to keep your packages small. Include only few procedures and functions that are used in the same context.	Major		Х	Х	
66	7220	Always use forward declaration for private functions and procedures.	Minor	х			
67	7230	Avoid declaring global variables public.	Major				
n/a	7250	Never use RETURN in package initialization block.	Major			Х	
69	7310	Avoid standalone procedures – put your procedures in packages.	Minor			х	
70	7320	Avoid using RETURN statements in a PROCEDURE.	Major			Х	
n/a	7330	Always assign values to OUT parameters.	Blocker			х	

71	7410	Avoid standalone functions – put your functions in packages.	Minor		х	
73	7420	Always make the RETURN statement the last statement of your function.	Major		Х	
72	7430	Try to use no more than one RETURN statement within a function.	Major		Х	
74	7440	Never use OUT parameters to return values from a function.	Major			
75	7450	Never return a NULL value from a BOOLEAN function.	Blocker			
n/a	7460	Try to define your packaged/standalone function deterministic if appropriate.	Major	х		
76	7510	Always prefix Oracle supplied packages with owner schema name.	Major			
77	7710	Avoid cascading triggers.	Major		Х	
n/a	7720	Never use multiple UPDATE OF in trigger event clause.	Blocker		Х	
n/a	7730	Avoid multiple DML events per trigger.	Minor		Х	
n/a	7740	Never handle multiple DML events per trigger if primary key is assigned in trigger.	Critical	х		
n/a	7810	Never use SQL inside PL/SQL to read sequence numbers (or SYSDATE).	Critical	Х	х	
n/a	7910	Never use DML within a SQL macro.	Blocker			
78	8110	Never use SELECT COUNT(*) if you are only interested in the existence of a row.	Critical	Х		

n/a	8120	Never check existence of a row to decide whether to create it or not.	Critical		Х		
79	8210	Always use synonyms when accessing objects of another application schema.	Minor	Х		Х	
n/a	8310	Always validate input parameter size by assigning the parameter to a size limited variable in the declaration section of program unit.	Major			Х	
n/a	8410	Always use application locks to ensure a program unit is only running once at a given time.	Blocker		Х		
n/a	8510	Always use dbms_application_info to track program process transiently.	Critical		Х		
n/a	9010	Always use a format model in string to date/time conversion functions.	Blocker	Х		Х	
n/a	9020	Try to use a format model and NLS_NUMERIC_CHARACTERS in string to number conversion functions.	Blocker	Х		х	
n/a	9030	Try to define a default value on conversion errors.	Major			Х	
n/a	9040	Try using FX in string to date/time conversion format model to avoid fuzzy conversion.	Blocker				

- 1. We see a table and a view as a collection. A jar containing beans is labeled "beans". In Java we call such a collection also "beans" (List<Bean> beans) and name an entry "bean" (for (Bean bean : beans) {...}). An entry of a table is a row (singular) and a table can contain an unbounded number of rows (plural). This and the fact that the Oracle Database uses the same concept for their tables and views lead to the decision to use the plural to name a table or a view.
- 2. It used to be good practice to use uppercase keywords and lowercase names to help visualize code structure. But practically all editors support more or less advanced color highlighting of code, similar to the examples in these guidelines. Hence as of version 4.0 we are now recommending all lowercase, as this is easier and faster for the brain to process. You may choose to prefer the old rule however, it is important to always be consistent, like for example keywords always in uppercase and names always in lowercase.
- 3. Tabs are not used because the indentation depends on the editor configuration. We want to ensure that the code looks the same, independent of the editor used. Hence, no tabs. But why not use 8 spaces? That's the traditional value for a tab. When writing a package function the code in the body has an indentation of 3. That's 24 characters as a starting point for the code. We think it's too much. Especially if we try to keep a line below 100 or 80 characters. Other good options would be 2 or 4 spaces. We settled for 3 spaces as a

compromise. The indentation is still good visible, but does not use too much space. \longleftarrow
